

CHEMICAL SYNTHONS AND INTERMEDIATES

RELATED APPLICATIONS

This application claims the benefit of priority from provisional application 60/410,421, filed September 13, 2002, which is incorporated in its entirety by reference herein.

FIELD OF THE INVENTION

The invention provides novel six and seven-carbon termini-differentiated polypropionate stereotetrads and stereopentads useful in syntheses of natural products, including bioactive agents, or for use in the synthesis of bioactive agents or other compounds. The invention also provides a novel alkylative sulfenylation-desulfonylation process that efficiently transforms enantiopure epoxyvinyl sulfones to syn and anti dienyldisulfides in two operations.

BACKGROUND OF THE INVENTION

The trimethyldiol stereopentad is a polypropionate sequence found in many medicinally active natural products. It is possible that the pair of hydrogen bond donors/acceptors in conjunction with the conformation-influencing characteristics of the methyl groups is responsible for recognition and binding of these materials at the active site of various biological targets. While the five-center stereopentad can exist in 32 stereoisomeric forms, it appears, based upon examination of the structure-searchable databases, that only 5 of these possibilities appear in natural products reported thus far. This number can be expanded to 10 by adding those compounds which bear a keto or an ethyl group at one of the alcohol or methyl positions, respectively.

The synthesis of biologically significant structures that incorporate polypropionate sequences has been the focal point of recent research efforts. The ever-increasing need for the preparation of chiral drugs as single enantiomers has fostered the evolution of methods of polypropionate segment synthesis including asymmetric aldol and asymmetric allyl metal additions to aldehydes.

All syntheses that target a single enantiomer ultimately must be related to one or more substances obtained from the chiral pool. It is recognized that syntheses that generate their asymmetry via a chiral catalyst are desirable because one molecule of catalyst is responsible for the creation of a multitude of new chiral progeny. For maximum effect, the chiral catalyst must be commercially available, deliver product in high yield, high ee, and exhibit high turnover numbers.

Multiply-convergent syntheses that combine stereochemically defined, functionality rich segments are often inefficient. Adoption of an easily scaled segment synthesis primarily impacts the probability of success of a synthetic project. Enantiopure segments prepared via catalytic processes have intrinsic advantages over stoichiometric use of enantiopure auxiliaries or reagents as these strategies are 'high overhead,' in that they generate added time and expense. Even successful syntheses that adopt the latter approach may be limited with respect to potential scale-up.

Cross-conjugated 6 and 7-membered dienyl sulfones have been developed and now comprise a collection of termini-differentiated acyclic arrays bearing 2-5 stereocenters. As illustrated in Figure 1, scheme 1, Jacobsen asymmetric epoxidation of dienylsulfone of 2 with about 1% catalyst loading can give greater than 80% yields of epoxides RR-3 or SS-3 with greater than 97% ee. Reapplication of the catalytic Jacobsen epoxidation protocol to 5 effects greater than 12:1 double stereoselection, providing greater than 75% isolated crystalline yields of the individual members of the 6 and 7 family with 97% de (Scheme 1). Trimethylaluminum or dimethylcuprate undergoes complementary addition to silyl ether *syn*-7, giving alcohols 8 and 10, respectively. Alternatively, reaction of alcohol *syn*-6 with methyl lithium provided the α -methylated product 9 α . While cleavage of the vinyl sulfones 8 and 10 β gave the pseudoenantiomers (enantiomers with protecting group reversal) 11 and 12 β , respectively, further evolution of these compounds in order to access polypropionates having C_{4,5} (arrows, scheme 1) functionalized would not be easily accomplished.

Accordingly, the need exists for improved stereospecific, efficient syntheses of sulfides and sulfones, including dienyl sulfides and sulfones. Novel enantiopure diastereomers made by such syntheses would also prove useful in a number of applications. For example, they could serve as bioactive agents, including

pharmaceutical compositions which have stereochemical requirements. Such compounds could also be used as standards for determining the stereochemistry of segments of natural products and other compounds which are suspected of having set stereochemistries within their chemical structures.

SUMMARY OF THE INVENTION

The invention provides novel six and seven-carbon termini-differentiated polypropionate stereotetrads and stereopentads useful in syntheses of natural products or other chemical compounds or as bioactive agents. The invention also provides a novel alkylative sulfonylation-desulfonylation process that efficiently transforms enantiopure epoxyvinyl sulfones to syn and anti dienylsulfides in two operations. This process permits the stereospecific functionalization of all six or seven carbons of a cyclohexyl or cycloheptyl system, ultimately providing six or seven-carbon termini-differentiated polypropionate stereotetrads and stereopentads appropriate for natural product synthesis.

More specifically, the invention in one embodiment employs epoxy vinylsulfone chemistry to provide improved processes for the general synthesis of both chiral 4-alkylcycloalkenones and enantiopure 2, 5-cyclohexadienone synthons. Epoxyvinyl sulfones are employed as a synthon for both unpoled enones as well as chiral 2, 5-cyclohexadienone equivalents in which one masked enone is charge-inverted, and the latent enone is normally polarized.

Referring to schemes 1-4, Figures 1-2, and the detailed description provided hereinafter, the invention in one embodiment provides enantiopure stereodiads **27** and **29** in five operations from cycloheptanone **1**, with overall yields in excess of around 40% on the 100g scale. These key substrates serve as progenitors to materials bearing up to five stereocenters on the 7-membered ring, thereby enabling synthesis of an entire collection of enantiopure diastereomers from catalytically-generated epoxide **3** (or **ent-3**). Enantiopure *anti* and *syn* stereodiads **27** and **29** can be used to prepare a group of termini-differentiated seven-carbon segments useful in syntheses of bioactive polypropionate derived natural products.

Further, in accordance with the invention and schemes 4a, 6a, 7a, 8a, and 9a described hereinafter in the detailed description, epoxy vinylsulfone chemistry provides improved

methodology for the general synthesis of chiral 4-alkylcycloalkenones and for enantiopure 2,5-cyclohexadienone synthons.

Accordingly, the invention includes, but is not limited to, compounds of the following formulae:

Where R^1 is a C_1 - C_5 alkyl group;

R^2 and R^3 are independently selected from H, a C_1 - C_4 alkyl group or a blocking group, preferably a silyl-containing blocking group such as a trimethyl silyl group or a t-butyl dimethyl silyl group; and

R is a phenyl or substituted phenyl group wherein the substituted phenyl group is substituted in one instance at the ortho, meta or para position of the phenyl group with a C₁-C₄ alkyl group, a halogen (F, Cl, Br, I) a nitro group, an amine, hydroxyl, alkyl ester (wherein the alkyl group on the ester is a C₁-C₄ alkyl group), alkylether (wherein the alkyl group on the ester is a C₁-C₄ alkyl group) or acyl group.

More preferred compounds according to the present invention are selected from the following chemical compounds:

Wherein R^1 is as described above.

Methods of making and using these compounds in the synthesis of bioactive agents, pharmaceutical compounds and other chemical compounds which contain chiral centers and specific stereochemistry are provided by the present invention.

The syntheses of the claimed compounds may be carried out readily using the methods which are identified hereinafter. Alternatives to the disclosed methods are contemplated by relying on analogous applications of the disclosed methods which are presented in significant detail hereinafter.

The present invention also relates to compounds according to the present invention wherein the compound is made by a process in which reaction of allyl sulfones with TMS triflate and an amine, preferably an organic amine such as triethylamine in a solvent such as methylene chloride at reflux effects regiospecific elimination to yield dienylsulfides; the dienylsulfides are oxidized through addition of an oxidizing agent, preferably a peroxide oxidizing agent such as *m*CPBA ; and wherein the process can be done one pot or in steps.

The present invention also relates to methods of making a compound according to the present invention by:

(a) reacting allyl sulfones of the formula

with TMS triflate and an amine, such as an organic amine including triethylamine in a solvent, such as methylene chloride, at reflux to yield a dienylsulfide of the formula

and oxidizing the dienyldisulfide with an oxidizing agent, preferably a peroxide oxidizing agent such as *m*CPBA,

where R is C₁-C₅ alkyl, phenyl, substituted phenyl, vinyl, alkynyl, trimethylsilyl or t-butyltrimethylsilyl and wherein the reaction can be done one pot or in steps.

The present invention also relates to compounds according to the present invention as otherwise described herein and methods of making such compounds, wherein the compound is made by alkylating an epoxyvinylsulfone of the formula

in a reaction medium comprising (R)₂CuLi, a solvent, such as an ether solvent, such as THF, Et₂O or a mixture of THF and Et₂O, where R is a C₁ to C₅ alkyl and wherein the reaction can be done one pot or in steps.

In other aspects of the present invention a compound according to the present invention is made by oxidizing an allylic alcohol of the formula

where R is a C₁ to C₅ alkyl, phenyl, substituted phenyl, vinyl, alkynyl, trimethylsilyl or t-butyltrimethylsilyl to yield a β-sulfonyl enone of the formula

wherein the β -sulfonyl enone is subjected to Michael addition of heterocuprates and subsequent β -elimination of sulfinate, and
 wherein the reactions are done one pot or in steps.

In still other aspects, a compound according to the present invention is made by reacting a sulfone of the formula

where R is a C_1 to C_5 alkyl, phenyl, substituted phenyl, vinyl, alkynyl, trimethylsilyl or t-butyldimethylsilyl with one or more alkyl halides.

In still other aspects, the present invention relates to a cleavage process comprising using a tetraacetate cleavage such as lead tetraacetate to promote oxidative cleavage cleavage of a compound of the formula

to yield an enantiopure aldehyde-ester of the formula

where R is a C₁ to C₅ alkyl, phenyl, substituted phenyl, vinyl, alkynyl, trimethylsilyl or t-butyltrimethylsilyl, the process is done one pot or in steps, and wherein the enantiopure aldehyde-ester is used in the synthesis of the C₁₂-C₁₈ fragment of rhizoxin D.

In still other aspects, the present invention relates to a synthetic method comprising:

(a) reacting allyl sulfones of the formula

with TMS triflate and an amine, preferably, triethylamine in a solvent, preferably, methylene chloride, at reflux to yield a dienylsulfide of the formula

and oxidizing the dieny sulfide with an oxidizing agent, preferably a peroxide oxidizing agent such as *m*CPBA, where R_a is C_1 - C_5 alkyl, phenyl, substituted phenyl, vinyl, alkynyl, trimethylsilyl or *t*-butyldimethylsilyl to yield a compound of the formula

wherein:

R^1 is a C_1 - C_4 alkyl group;

R^2 and R^3 are independently selected from H, a C_1 - C_4 alkyl group or a blocking group, preferably a silyl-containing blocking group such as a trimethyl silyl group or a t-butyl dimethyl silyl group; and

R is a phenyl or substituted phenyl group wherein the substituted phenyl group is substituted in one instance at the ortho, meta or para position of the phenyl group with a C_1 - C_4 alkyl group, a halogen (F, Cl, Br, I) a nitro group, an amine, hydroxyl, alkyl ester (wherein the alkyl group on the ester is a C_1 - C_4 alkyl group), alkylether (wherein the alkyl group on the ester is a C_1 - C_4 alkyl group) or acyl group, and wherein the reaction can be done one pot or in steps.

These and other aspects of the instant invention are described further in the following detailed description.

BRIEF DESCRIPTION OF THE DRAWINGS

DETAILED DESCRIPTION OF THE INVENTION

As used herein, the following terms have the following respective meanings. Other terms that are used to describe the present invention have the same definitions as

those generally used by those skilled in the art. Specific examples recited in any definition are not intended to be limiting in any way.

“Hydrocarbon” refers to a substituted or unsubstituted organic compound.

“Acetal” refers to a compound in which two ether oxygens are bound to the same carbon. A “ketal” is an acetal derived from a ketone.

“Acyl” means a compound of the formula RCO, where R is aliphatic (characterized by a straight chain of carbon atoms), alicyclic (a saturated hydrocarbon containing at least one ring), or aromatic.

“Acyloxy” refers to the groups alkyl-C(O)O--, substituted alkyl-C(O)O--, cycloalkyl-C(O)O--, substituted cycloalkyl-C(O)O--, aryl-C(O)O--, heteroaryl-C(O)O--, and heterocyclic-C(O)O-- wherein alkyl, substituted alkyl, cycloalkyl, substituted cycloalkyl, aryl, heteroaryl, and heterocyclic are as defined herein

“Alkyl” refers to a fully saturated monovalent hydrocarbon radical containing carbon and hydrogen which may be a straight chain, branched, or cyclic. Examples of alkyl groups are methyl, ethyl, n-butyl, n-heptyl, isopropyl, 2-methylpropyl, cyclopropyl, cyclopropylmethyl, cyclobutyl, cyclopentyl, cyclopentylethyl and cyclohexyl. “Cycloalkyl” groups refer to cyclic alkyl groups such as cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl. C₁-C₇ alkyl groups are preferably used in the present invention.

“Substituted alkyl” refers to alkyls as just described which include one or more functional groups such as an alkyl containing from 1 to 6 carbon atoms, preferably a lower alkyl containing 1-3 carbon atoms, aryl, substituted aryl, acyl, halogen (i.e., alkyl halos, e.g., CF₃), hydroxy, alkoxy, alkoxyalkyl, amino, alkyl and dialkyl amino, acylamino, acyloxy, aryloxy, aryloxyalkyl, carboxyalkyl, carboxamido, thio, thioethers, both saturated and unsaturated cyclic hydrocarbons, heterocycles and the like. The term “substituted cycloalkyl” has essentially the same definition as and is subsumed under the term “substituted alkyl” for purposes of describing the present invention.

“Amine” refers to aliphatic amines, aromatic amines (e.g., aniline), saturated heterocyclic amines (e.g., piperidine), and substituted derivatives such as an alkyl morpholine. “Amine” as used herein includes nitrogen-containing aromatic heterocyclic compounds such as pyridine or purine.

"Aralkyl" refers to an alkyl group with an aryl substituent, and the term "aralkylene" refers to an alkenyl group with an aryl substituent. The term "alkaryl" refers to an aryl group that has an alkyl substituent, and the term "alkarylene" refers to an arylene group with an alkyl substituent. The term "arylene" refers to the diradical derived from aryl (including substituted aryl) as exemplified by 1,2-phenylene, 1,3-phenylene, 1,4-phenylene, 1,2-naphthylene and the like.

"Alkenyl" refers to a branched or unbranched hydrocarbon group typically although not necessarily containing 2 to about 24 carbon atoms and at least one double bond, such as ethenyl, n-propenyl, isopropenyl, n-butenyl, isobutenyl, octenyl, decenyl, and the like. Generally, although again not necessarily, alkenyl groups herein contain 2 to about 12 carbon atoms. The term "lower alkenyl" intends an alkenyl group of two to six carbon atoms, preferably two to four carbon atoms.

"Substituted alkenyl" refers to alkenyl substituted with one or more substituent groups, and the terms "heteroatom-containing alkenyl" and "heteroalkenyl" refer to alkenyl in which at least one carbon atom is replaced with a heteroatom.

"Aryl" refers to a substituted or unsubstituted monovalent aromatic radical having a single ring (e.g., phenyl) or multiple condensed rings (e.g., naphthyl). Other examples include heterocyclic aromatic ring groups having one or more nitrogen, oxygen, or sulfur atoms in the ring, such as imidazolyl, furyl, pyrrolyl, pyridyl, thienyl and indolyl, among others. Therefore, "aryl" as used herein includes "heteroaryls" having a mono- or polycyclic ring system which contains 1 to 15 carbon atoms and 1 to 4 heteroatoms, and in which at least one ring of the ring system is aromatic. Heteroatoms are sulfur, nitrogen or oxygen.

"Substituted aryl" refers to an aryl as just described that contains one or more functional groups such as lower alkyl, acyl, aryl, halogen, alkylhalos (e.g., CF₃), hydroxy, alkoxy, alkoxyalkyl, amino, alkyl and dialkyl amino, acylamino, acyloxy, aryloxy, aryloxyalkyl, carboxyalkyl, carboxamido, thio, thioethers, both saturated and unsaturated cyclic hydrocarbons, heterocycles and the like.

"Alkynyl" as used herein refers to a branched or unbranched hydrocarbon group typically although not necessarily containing 2 to about 24 carbon atoms and at least one triple bond, such as ethynyl, n-propynyl, isopropynyl, n-butylnyl, isobutylnyl, octynyl,

decynyl, and the like. Generally, although again not necessarily, alkynyl groups herein contain 2 to about 12 carbon atoms. The term "lower alkynyl" intends an alkynyl group of two to six carbon atoms, preferably three or four carbon atoms. "Substituted alkynyl" refers to alkynyl substituted with one or more substituent groups, and the terms "heteroatom-containing alkynyl" and "heteroalkynyl" refer to alkynyl in which at least one carbon atom is replaced with a heteroatom.

"Alkoxy" as used herein refers to an alkyl group bound through an ether linkage; that is, an "alkoxy" group may be represented as --O--alkyl where alkyl is as defined above. A "lower alkoxy" group intends an alkoxy group containing one to six, more preferably one to four, carbon atoms.

"Allenyl" is used herein in the conventional sense to refer to a molecular segment having the structure --CH=C=CH_2 . An "allenyl" group may be unsubstituted or substituted with one or more non-hydrogen substituents.

"Anomer" as used herein means one of a pair of isomers of a cyclic carbohydrate resulting from creation of a new point of symmetry when a rearrangement of atoms occurs at an aldehyde or ketone position.

"Halo" and "halogen" are used in the conventional sense to refer to a chloro, bromo, fluoro or iodo substituent. The terms "haloalkyl," "haloalkenyl" or "haloalkynyl" (or "halogenated alkyl," "halogenated alkenyl," or "halogenated alkynyl") refers to an alkyl, alkenyl or alkynyl group, respectively, in which at least one of the hydrogen atoms in the group has been replaced with a halogen atom.

"Heterocycle" or "heterocyclic" refers to a carbocyclic ring wherein one or more carbon atoms have been replaced with one or more heteroatoms such as nitrogen, oxygen or sulfur. A substitutable nitrogen on an aromatic or non-aromatic heterocyclic ring may be optionally substituted. The heteroatoms N or S may also exist in oxidized form such as NO, SO and SO₂. Examples of heterocycles include, but are not limited to, piperidine, pyrrolidine, morpholine, thiomorpholine, piperazine, tetrahydrofuran, tetrahydropyran, 2-pyrrolidinone, δ -velerolactam, δ -velerolactone and 2-ketopiperazine, among numerous others.

"Heteroatom-containing" refers to a molecule or molecular fragment in which one or more carbon atoms is replaced with an atom other carbon, e.g., nitrogen, oxygen,

sulfur, phosphorus or silicon. "Substituted heterocycle" refers to a heterocycle as just described that contains one or more functional groups such as lower alkyl, acyl, aryl, cyano, halogen, hydroxy, alkoxy, alkoxyalkyl, amino, alkyl and dialkyl amino, acylamino, acyloxy, aryloxy, aryloxyalkyl, carboxyalkyl, carboxamido, thio, thioethers, both saturated and unsaturated cyclic hydrocarbons, heterocycles and the like. In other instances where the term "substituted" is used, the substituents which fall under this definition may be readily gleaned from the other definitions of substituents which are presented in the specification as well the circumstances under which such substituents occur in a given chemical compound. One having ordinary skill in the art will recognize that the maximum number of heteroatoms in a stable, chemically feasible heterocyclic ring, whether it is aromatic or non-aromatic, is determined by the size of the ring, degree of unsaturation, and valence of the heteroatoms. In general, a heterocyclic ring may have one to four heteroatoms so long as the heterocyclic ring is chemically feasible and stable.

"Isostere" refers to compounds that have substantially similar physical properties as a result of having substantially similar electron arrangements.

"Substituted", as in "substituted alkyl" or "substituted alkenyl", means that in the hydrocarbyl, hydrocarbylene, alkyl, alkenyl or other moiety, at least one hydrogen atom bound to a carbon atom is replaced with one or more substituents that are functional groups such as hydroxyl, alkoxy, thio, amino, halo, silyl, and the like. When the term "substituted" appears prior to a list of possible substituted groups, it is intended that the term apply to every member of that group.

"Effective amount" refers to the amount of a selected compound, intermediate or reactant which is used to produce an intended result. The precise amount of a compound, intermediate or reactant used will vary depending upon the particular compound selected and its intended use, the age and weight of the subject, route of administration, and so forth, but may be easily determined by routine experimentation. In the case of the treatment of a condition or disease state, an effective amount is that amount which is used to effectively treat the particular condition or disease state. Therefore, "effective amount" includes amounts of compounds of the instant invention that are effective in treating: anxiolytic disorders; a condition requiring treatment of injured mammalian nerve tissue; a condition amenable to treatment through

administration of a neurotrophic factor; a neurological disorder; obesity; an obesity-related disorder; or a condition related to an endocrine function including involution and infertility.

The term "subjects" is used throughout the specification to describe an animal, preferably a human, to whom treatment, including prophylactic treatment, with the compositions according to the present invention is provided. For treatment of those infections, conditions or disease states which are specific for a specific animal such as a human patient, the term patient refers to that specific animal.

Chemistry

Referring to Figure 1, schemes 1 and 2, compounds **4** and **5** were treated with methyl lithium to generate allyl sulfonyl anions **4Li₂** and **5Li**, respectively. Quenching of these anions at low temperature delivered **14α** and **15β** (as mixtures of sulfone diastereomers, E=H) in excess of 85% yield. HPLC analysis revealed that methylation of both intermediates occurred with complementary greater than 10:1 diastereoselectivity. Sulfonylation with dimethyldisulfide or methylthiolsulfonate gave a complicated mixture

of products, which appeared to involve both α and γ -sulfenylation of the intermediate allylic anions. Attempted hydrolysis of these mixtures to enones **16** or **17** was unrewarding (Figure 1, Scheme 2).

Reaction of the allylic anions **4Li₂** and **5Li** with the more sterically-demanding diphenyldisulfide suffered regiospecific quenching at the γ -position, initially affording *syn*-**18** and *anti*-**19**, as a mixture of sulfide diastereomers. Monitoring of the reaction revealed that isomerization of intermediate vinylsulfones *syn*-**18** and *anti*-**19** to allyl sulfones *syn*-**21** and *anti*-**22** occurs under the basic reaction conditions (Figure 2, Scheme 3). While ionization of the γ -phenylsulfonyl moiety of acyclic vinyl ethers and vinyl sulfides is known to generate enones and enals, the corresponding reaction for cyclic substrates is far less common.

Reaction of allyl sulfones *syn*-**21** and *anti*-**22** with TMS triflate and triethylamine in methylene chloride at reflux effected regiospecific elimination to dienylsulfides *syn*-**29** and *anti*-**27**. This transformation relies upon the unique amphoteric nature of the sulfone moiety. While sulfones are used as withdrawing groups to polarize olefins and inductively stabilize anions, it is the leaving group ability of phenyl sulfinic acid (pK_a 7.1), which enables the lone pair of phenylvinyl sulfide group to expel sulfinate.^[i] Presumably the silyl triflate serves to activate the sulfone moiety by reversible oxygen silylation (to **24**, **25**), thereby also preventing readdition of silyl sulfinate **26** once the vinyl thionium ion loses proximal proton H_a. Oxidation of **27** and **29** to key dienyl sulfones **27ox** and **29ox** can be achieved by addition of *m*CPBA to the crude reaction mixture. This two-operation sequence enables stereoselective methylation with simultaneous establishment of a new, transposed diene (Figure 1, Scheme 3). This transformation provides enantiopure stereodiads **27** and **29** in five operations from cycloheptanone **1** (overall yields are in excess of 40% on the 100g scale).

The dienyl sulfone strategy proves useful in those cases where 4-5 stereocenters are required. As described, these key substrates serve as progenitors to materials bearing up to five stereocenters on the 7-membered ring, thereby enabling synthesis of an entire collection of enantiopure diastereomers from catalytically-generated epoxide **3** (or **ent-3**). Employing the TMS ether **13** afforded the unexpected *syn*-**28** after elimination of the sulfone moiety. Syn-addition via direction by OLi groups has been demonstrated on

many occasions, but since silyloxy groups are generally held not to promote oxygen-coordinated direction, it appeared possible that more subtle conformational effects were involved. Conformational modeling show the TMS ether **19** preferred an equatorial oxygen, which placed the TMS group away from the α -face of the vinyl sulfone, providing unencumbered access for conjugate addition.

To demonstrate the value of enantiopure *anti* and *syn* stereodiads **27** and **29**, applicants prepared a group of termini-differentiated seven-carbon segments projected to be of use in synthesis of bioactive polypropionate derived natural products. Targets initially investigated used *syn*-intermediates **21**, **23**, **29** as enantiopure starting materials; *anti*-intermediates **19**, **22**, **27** could also be used.

Further functionalization of these substrates gives cycloheptenyl sulfones, which afford termini-differentiated aldehyde segments after oxidative cleavage. For example, referring to Figure 3, scheme 4, direct methylation of the dianion of alcohol **29** produced dienylsulfide **31** (confirmed by X-ray). Oxidation of **31** affords dienyl sulfone **32** in 70 % overall yield from **29**. The necessity of ‘protection’ of the alcohol moiety as an oxido anion is apparent from attempted alkylation of TBS ether **29**, which suffers β -elimination to trienylsulfide **30**. Treatment of the dianion of **29** with Eschenmoser’s reagent gives amine **34**, which undergoes smooth tris-oxidation to trienylsulfone **35** upon exposure to excess *m*CPBA. Oxidation of dienylsulfones **32** and **33** using *m*CPBA was unselective, but high diastereoselectivity could be obtained using Molybdenum, Manganese, and Osmium catalyzed oxidations to prepare **36-39** (Scheme 4).

Approach to Rhizoxin

Rhizoxin, the bis epoxide of rhizoxin D **40**, was isolated by Okuda from *Rhizopus chinensis* infected rice seedlings (Scheme 5). Eight total and/or formal syntheses of rhizoxin (four via rhizoxin D) have been reported.

The plan for the synthesis of rhizoxin D **40** in accordance with the invention involves a 1-2 pot method of sequentially joining a pair of carbonyl compounds with a two-carbon bis-olefination splicer (Figure 4, Scheme 5). Acylation of **ent-21** followed by hydrolysis gives β -sulfonyl ketone **41**, which was then transformed to silyl

dienylether **42**. Singlet oxygen addition to **42** effected stereospecific (OTIPS necessary for greater than 95% β -face addition) formation of stable bicyclic peroxide **43**.

Dimethyl dioxirane (DMDO) epoxidation of silyl enoether **43** provided the *isolable* α -epoxysilyl ether **44**. Hydrogenation of **44** proceeded, as desired, with silicon migration to give diol **46** in 83% yield. Methylation of the keto-diol **46** required dimethyltin chloride catalysis to effect regiospecific O-methylation at the more electron-rich distal alcohol, rapidly providing ketone **47** in high yield (first example for a 1-keto-2,3-diol). Methylation or silylation without the tin catalyst was very slow and strongly favored functionalization of the opposite alcohol. Lead tetraacetate cleavage of **47** in methanol completed the synthesis of enantiopure aldehyde-ester **48** (Scheme 5).

Concanamycin F

Concanamycin F **49**, also called concanolide A, is the most intricate parent aglycone of a series of related macrocyclic lactones bearing considerable structural homology (Scheme 6). This family also includes biafilomycin A and hygrolidin. Concanamycin F **49** has been synthesized by the groups of Paterson in 2000 and Toshima in 2001 in 44 and 53 operations, respectively. Paterson, V. A. Doughty, M. D. McLeod, T. Trieselmann, *Angew. Chem. Int. Ed. Engl.* **2000**, 39, 1308-1312; *Angew. Chem.* **2000**, 1364-1368.

Referring to Figure 5, scheme 6, analysis of concanamycin F **49** envisages the construction of a pair of stereopentads to be derived from vinyl sulfones **50** and **53**. Diol **39** is used to generate stereopentad **51**. Silylation of **39** provided vinylsulfone **52** in quantitative yield which was directly methylated in DMSO to give vinylsulfone **53** in 94% overall yield. Ozonolysis of **53** afforded ester-aldehyde **51** in 92% yield. Compound **51** is the enantiomer of the C15-C21 stereopentad of concanamycin F **49** (Scheme 6).

Apoptolidin

Apoptolidin **54** is a 20-membered macrocyclic lactone isolated from *Norcardiopsis* sp (Figure 6, Scheme 7). Apoptolidin induced apoptotic cell death in rat gila cells transformed with the E1A oncogene at 11 ng/mL but did not cause cell death in normal gila cells or fibroblasts at greater than 100 g/mL.

Discodermolide **55**, like paclitaxel (taxol), has been shown to stabilize microtubules, but is more potent and inhibits the growth of paclitaxel-resistant cells. The

material is in high demand for clinical trials, and synthesis is the only option. Five total syntheses and related synthetic approaches all using aldol-based acyclic stereoselection strategies beginning with enantiopure 3-hydroxy 2-methylpropionate have been reported. The second generation Smith synthesis utilized 34 total operations and enabled delivery of the first gram of (+)-discodermolide **55** with a linear supply line of only 24 operations. The overall yield was 6%.

Referring to Figure 6, synthesis of apoptolidin **54** and discodermolide **55** in accordance with the invention makes use of the central stereotriads **32** and **33** as precursors to key epoxides α **36** and β **36**, respectively. Preparation of the C21-C27 segment of apoptolidin **54** is accomplished from epoxide β **36** beginning with selective 1,2-reduction with DIBAL-H to provide alcohol **56**. The complementary 1, 4-reduction process to produce alcohol **59** can be selectively achieved using borane-THF. Completion of the apoptolidin segment synthesis simply involves ozonolysis of **56** to a δ -hydroxy aldehyde intermediate, which suffers cyclization to hemiacetal **57**. Protection of **57** as acetal **58** gave a 4:1 mixture of anomers, which can be easily separated by silica column chromatography (Scheme 7). Acetal **58** is also the C20-26 segment of phorboxazole (not shown).

In parallel fashion to the synthesis of **58**, it was possible to prepare the C1-C7 segment of discodermolide **55** by employing epoxide α **36** for 1,2-reduction with DIBAL-H. This afforded alcohol **60** in 65% yield. Subsequent ozonolysis afforded hemiacetal **61**, which smoothly underwent PDC oxidation to give lactone-ester **62** in 75% yield (Scheme 7).

Evaluation of the Cycloheptadienyl Sulfone **2** as a Stereopentad Precursor

Referring to Figures 1 and 7, synthesis of segment **51**, in accordance with the invention begins with cycloheptanone **1**. The sulfur atoms used in this strategy are essential for the synthesis (Figure 1). The initial vinyl sulfide activates the olefin for bromination in operation *1b*, after being oxidized to sulfone in *1c*, the resultant sulfone regiospecifically activates the allylic position for base promoted 1,4 elimination in operation *1d* to dienyl sulfone **2**. The electrophilic olefin of cross-conjugated dienyl sulfone **2** is flanked by a sterically demanding

*sp*³-hybridized sulfone moiety, which has been shown to be crucial for obtaining the high enantiomeric excess obtained in the Jacobsen epoxidation. Once again, in operation 3*a* the epoxy vinyl sulfone **3** undergoes 1,4 elimination to provide intermediate **4** which suffers conjugate-addition with methyl lithium in operation 3*b* to provide an allyl sulfonyl anion **66**, which is directly sulfenylated to **67** in stage 3*c*. Vinyl sulfone **67** equilibrates to **68** at stage 3*d* and is finally protonated to **21** at stage 3*e*. Vinylogous dioxythioacetal **21** undergoes vinyl sulfide promoted loss of sulfinic acid at operation 4 to afford cross-conjugated dienyl sulfide **29** after workup. Methylation of the dianion of **29**, followed by oxidation of sulfide, and alcohol protection gives **33**. Catalytic substrate-based dihydroxylation followed by regiospecific silylation of the more available alcohol generates alcohol **52**, which undergoes O-methylation to **53**, then cleavage of the final vinyl sulfone to deliver the target stereopentad **51**.

In the course of this synthesis, applicants have introduced and ultimately removed two phenyl sulfone moieties; and while these factors are negative from the viewpoint of atom-economy, they are absolutely essential to achieve the chemistry. The dienyl sulfone synthesis of **51** exploits a chiral catalyst and then relates all further stereochemistry to the newly created stereocenter(s). This creates less costly 'overhead' than a synthesis employing an enantiopure starting material and then twice using either a chiral reagent or a chiral auxiliary. This difference will be especially significant in situations where reactions need to be conducted on a significant scale; since auxiliary or reagent cost, recycle, and/or disposal all strongly impact production cost.

General synthesis of chiral 4-alkylcycloalkenones and for enantiopure 2,5-cyclohexadienone synthons

Methylation of epoxyvinylsulfone **SS-9a** (Scheme 4a below) proceeds with about 96/4 *trans/cis* specificity for *trans* adduct **14a**. Duplication of this reaction with enantiopure **SS-9a** using chiral HPLC analysis reveals that the reaction is essentially stereospecific (Table 1a, entry 1). Repetition of the process for the additional alkyl groups shown in Table 1a can be conveniently conducted with cuprates derived from both lithium and Grignard reagents without

the need for addition of any alkyl aluminum reagent (Scheme 4a). The reactions are all high yielding and the product can be directly O-methylated as crude material. Methylation using MeI in basic DMSO is high yielding, fast, and does not require chromatography either before or after the process (Table 1a). Substantial empirical efforts failed to increase the selectivity of phenyl addition beyond 3:1.

Scheme 4a

Addition of *t*-BuLi at -78°C to **13at** generates a bright orange solution which, after 15 minutes, is quenched with saturated NaHCO₃ providing a mixture of sulfone diastereomers **15a** in high yield accompanied by less than 3% of the desired enone **14aMe** by NMR (Scheme 5a). An attempt to hydrolyze diastereomeric vinyl ethers **15a** to ketone **14aMe** using 5% oxalic acid in 1:1 methanol/water was interrupted after 1 h at 25°C. TLC analysis incorrectly suggested that the reaction contained only the mixture of starting vinyl ethers **15a**. It was later revealed that **15a**, **14aMe**, and **16a** have the same *R_f* value on TLC in the assay system employed. During workup, 10% NaOH was added to the diluted reaction mixture, which was then extracted with CH₂Cl₂. NMR analysis showed that **15a** had been completely hydrolyzed to **16a** with about 40% conversion to enone **14aMe**. Et₃N was added to a mixture of β-ketosulfones **16a** and enone **14aMe** in CH₂Cl₂. The ratio did not change. Heating the mixture to reflux in CH₂Cl₂, then in dichloroethane, and finally adding DBU did not positively affect the ratio and side products began to dominate the crude NMR. Since acidic conditions seemed to facilitate elimination, the process was repeated and the oxalic acid hydrolysis step was allowed to stir overnight. The ratio, as analyzed by NMR, was worse, 75% **16a** and 25% **14aMe**.

Scheme 5a

Adding the crude **16a/14aMe** mixture to THF/water containing 3% Et_3N and allowing the reaction to stir at 25°C for 9 h was highly effective. The ratio of THF to water is critical. The substrate is dissolved in THF (approx. 0.09M), water is added until the reaction becomes slightly cloudy, then the minimum amount of THF is added to establish homogeneity. This process is ineffective without an aqueous wash of the initial reaction, because the lithium salt content does not allow the THF and water to be completely miscible.

Presumably, the basic aqueous conditions are more effective than in CH_2Cl_2 because of the greater polarity of the media. Furthermore, the literature reveals that elimination of sulfinate from γ ketosulfones is a reversible process, and that the equilibria lies far towards the side of the β -ketosulfone under acidic conditions.

With a convenient method for conversion of the isomerized allyl sulfone to the desired enone finally in hand, 4-methylcyclohex-2-en-1-one **14aMe** was produced in 93% yield. It is significant that the sp^3 cuprate additions to **SS-9a** are about 100% *anti* throughout the series of methyl, ethyl, isopropyl, and *t*-butyl substituents as assayed by chiral HPLC of the resulting enones (**14a**) shown in Table 2a.

[†]HPLC analysis; *By rotation, HPLC inseparable; [§] Enriched by crystallization. ⁱⁱ

Epoxy vinylsulfone **SS-9a** can be obtained in excess of 99% ee, but in this experiment the ee of epoxide **SS-9a** was fixed at 93% by doping with racemic material, providing an unambiguous HPLC control. Except for **14Mea** (chiral HPLC inseparable; 93% by rotation), all the ee values in Table 2a were determined by HPLC analysis. With the possible exception of the *t*-butyl experiment, the reactions in Table 2a are held to be 100% enantiospecific within the limits of experimental detection.

γ -methoxyallyl sulfone anions can be quenched with electrophiles. Extension of this method to the more highly functionalized materials prepared in this study reveals that alkylations of proximally substituted γ -methoxyallyl sulfone anions are strongly influenced by the steric demands of the electrophile (Scheme 6a). As can be seen in Table 3a, synthesis of 3-substituted-4-alkyl cyclohex-2-en-1-ones bearing a secondary substituent in the 4-position are reluctant to alkylate under 'standard' conditions, but can be successfully alkylated provided that

HMPA is added to the γ -methoxyallyl sulfone anion during the alkylation phase. Still, these conditions cannot overcome the steric demands of the electrophile, with the 3,4-bisisopropyl adduct only being formed in 5-10% yield even using the HMPA protocol.

A complementary method for synthesis of 3-substituted-4-alkyl cyclohex-2-en-1-ones **14a** involves reversing the role of nucleophile and electrophile. Oxidation of allylic alcohols **12aa,ba** to β -sulfonyl enones **17aa,ba** using activated MnO_2 is high yielding. Michael addition of heterocuprates with subsequent β -elimination of sulfinate gives the desired 3,4-disubstituted enones **14a** in fair yield (Table 4a, Scheme 7a). While cuprate reactions are well known for

vinyllogous thiolesters, this is apparently the first report with vinyllogous acyl sulfones **17a** (β -sulfonyl enones).

2-substituted 4-alkylcyclohexenones are also available by the addition of 2 equiv. of alkyl or aryl lithium followed by oxidation and elimination to the desired enone. Application of this process to **t-12ba** gives enone **19a** in 90% yield (Scheme 8a). Extension of the strategy for synthesis of 2,3,4-trisubstituted enones was also examined beginning with alcohol **t-12ba**. In this instance, addition of the methyl lithium and subsequent capture of the anion with the methyl iodide produces **20a** as a mixture of isomers. Oxidation of **20a** followed by elimination furnishes trisubstituted enone **21a** in excellent yield.

Scheme 8a

Enantiopure epoxyvinyl sulfone **SS-9a** also can serve as a synthon for differentiated cyclohexa-2,5-dienones. Treatment of **SS-9a** with one equivalent of LiHMDS followed by addition of methyl- or isopropyl-lithium proceeds via sequential γ -metalation/epoxide fragmentation followed by OM-directed conjugate-addition with quenching α to the sulfone moiety to generate **22a** as shown in Table 5a and Scheme 9a. $\text{Mo}(\text{CO})_3$ catalyzed directed epoxidation with *t*Bu-OOH gives **23a**; DBU treatment of **23a** for the absolute minimal time ($<1\text{h}$) cleanly effects β -elimination of the epoxide moiety. Methylation of the resulting γ -sulfonyl allyl alcohol may be done in the same operation to provide **24a** in the yields indicated in Table 5a. Treatment of **24a** with *t*-butyllithium affords an allylic anion which reacts with methyl iodide (HMPA essential) to give enantiopure enones **25a** in greater than 92% yield.

The invention is described further in the following examples, which are illustrative and in no way limiting.

EXAMPLES

Experimental Procedures and Spectral Assignment

General Procedures

All purchased reagents were used as received. Tetrahydrofuran (THF) and diethyl ether (Et₂O) were distilled from sodium benzophenone ketyl. Benzene, toluene, dichloromethane (CH₂Cl₂), anhydrous methanol, dimethyl sulfoxide (DMSO), were

distilled from calcium hydride. Acetonitrile (CH_3CN), chloroform (CHCl_3), and methanol were spectra-grade. *n*-BuLi and *t*-BuLi were titrated prior to use by dropwise addition to a solution of *N*-benzylbenzamide in THF at -78°C to 0°C . Sodium sulfate (Na_2SO_4) and magnesium sulfate (MgSO_4) were used as received. Powdered 4Å molecular sieves (Aldrich) were oven and/or flame activated under vacuum prior to use.

Glassware was oven dried and/or flame dried. All reactions were carried out under a positive pressure of argon in anhydrous solvents (unless otherwise indicated), and the reaction flasks were fitted with rubber septa for the introduction of substrates and reagents via syringe. Unless otherwise noted all reaction were worked up using standard conditions. Standard workup conditions are the addition of an equal volume of the stated organic solvent followed by two equal volumes of water or aqueous solution. All subsequent washes were preformed with volumes equal to the organic solution being washed. The progress of reactions was monitored by thin layer chromatography (TLC) in comparison with the starting material(s). TLC was performed on glass-backed silica gel 60 F 254 plates (EM reagents, 0.25 mm) and eluted with (v/v) Ethyl Acetate (EA) in hexanes (Hex) or the specified solvent solutions. The TLC plates were visualized with a UV lamp (254 nm) and/or with TLC visualizing solutions activated with heat. The two commonly employed TLC visualizing solutions were: (i) *p*-anisaldehyde solution (1350 mL absolute ethanol, 50 mL concentrated H_2SO_4 , 15 mL glacial acetic acid, 37 mL *p*-anisaldehyde), and (ii) permanganate solution (weight percents of 1% KMnO_4 and 2% Na_2CO_3 in H_2O). All organic extracts were dried with MgSO_4 unless otherwise noted. Analytical samples were obtained from flash silica gel chromatography (SGC), using silica gel of 230-400 mesh, or from recrystallization of the crude products. Silica gel was washed with Et_3N and acetone to render it deactivated. Melting points were obtained on a MEL-TEMP capillary melting point apparatus and uncorrected. Optical rotations were taken on a Rudolph Research Autopol III instrument at 25°C . ^1H -NMR spectra were recorded on Varian IONVA-300 (300 MHz) and Varian VXR (500 MHz) spectrometers. ^{13}C -NMR spectra were recorded on Varian INOVA-300 (75 MHz) and Varian VXR (125 MHz) spectrometers. NMR spectra were determined in chloroform- d_1 (CDCl_3) solution and are reported in parts per million (ppm) from the residual chloroform (7.26 ppm and

77.00 ppm). Peak multiplicities in ^1H -NMR spectra, when reported, are abbreviated as s (singlet), d (doublet), t (triplet), m (multiplet), and b (broad). Mass spectra were run by the Purdue University campus wide mass spectrometry facility. The low resolution EI and CI (isobutane) spectra were obtained on a Finnigan 4000 mass spectrometer with a Nova 4 data system with the molecular ion designated as " M^+ ." The high resolution mass spectra were obtained on a Kratos MS-50 instrument.

General Procedure for the addition of mixed alkyl cuprates to epoxyvinyl sulfone

To 530 mg (5.9 mmol) dry CuCN in 25 mL THF cooled to -78°C was added 1.15 eq (4.86 mmol) of the desired alkyl lithium or Grignard reagent. The stirred mixture was allowed to warm to -20°C for 15 min. The reaction temperature was returned to -78°C and 1.0 g (4.23 mmol) epoxyvinyl sulfone in 10 mL THF was added via cannula. The reaction was then allowed to stir for 4-6 h without further cooling. When complete by TLC, the reaction was quenched with sat'd NH_4Cl and extracted with ether. The organic layer was then washed again with 5% HCl. After drying and removing the solvent *in vacuo* the resulting material can typically be used without purification and was 95% pure by NMR.

General procedure for the etherification of γ -hydroxy vinyl sulfones

Crude γ -hydroxy vinyl sulfone (4.0 mmol), was dissolved and rapidly stirred in 30 mL anhydrous DMSO and cooled in a 25°C water bath. 20-30 equiv. of MeI were added. Powdered KOH was added slowly, approximately 1 pellet every 3 min for a total of 5 pellets. When complete by TLC, the dark mixture was poured into ice water. The mixture was extracted with ether 3 times and the solvent removed *in vacuo*. SGC, 6:4 Hex/EA, provided the desired methyl ethers in nearly quant. yield.

General procedure for the conversion of γ -methoxy vinyl sulfones to enones

1.2 equiv. of *t*-BuLi (0.61 mmol) were added to the γ -methoxy vinyl sulfone (0.51 mmol) in 20 mL THF at -78°C over 2 min. The resulting bright orange reaction was stirred at this temperature for 25 min. 10 mL sat'd solution of NaHCO_3 was added and the reaction allowed to warm to room temperature. The mixture was extracted into 40 mL ether and concentrated. 15 mL THF was added followed by water until the two solvents begin to separate. More THF was added just until the solution becomes homogeneous. 0.5 mL Et_3N was then added and the reaction was stirred for 15 h. Monitoring the

reaction was best accomplished by NMR. When complete, ether and water was added and the organic layer separated and the solvent was removed *in vacuo*. SGC, 8:2 Hex/EA, provided the desired enones in good yield.

EXAMPLE 1

(1R)-(3-Benzenesulfonylcyclohepta-2,4-dienyloxy)-trimethylsilane

(13): A solution of alcohol **4** (1.56 g, 6.23 mmol) and imidazole (0.85 g, 12.48 mmol) in methylene chloride (20 mL) was cooled to 0 °C, and 0.87 mL (6.85 mmol) of TMSCl was added dropwise. The resulting suspension was stirred at 0 °C for 1 h. The mixture was then filtered through a short silica gel pad and washed with a mixture of ethyl acetate and hexanes (1:2). The filtrate was concentrated via rotary evaporation, and further dried under vacuum to give **13** (1.86 g, 93%) as a white solid. m.p = 61.9 – 63.8 °C; ¹H NMR (CDCl₃, 300 MHz) δ 7.85-7.88 (m, 2H), 7.50-7.63 (m, 3H), 7.16 (d, *J* = 3.3 Hz, 1H), 6.03-6.14 (m, 2H), 4.48-4.53 (m, 1H), 2.26-2.32 (m, 2H), 1.90-2.08 (m, 2H), 0.17 (s, 9H); ¹³C NMR (CDCl₃, 75 MHz) δ 144.4, 139.6, 139.0, 136.8, 133.1, 129.0, 127.8, 118.8, 70.0, 35.3, 26.2, -0.04.

EXAMPLE 2

(1R, 2R, 3R)-3-Benzenesulfonyl-2-methyl-5-

phenylsulfanylcyclohept-4-enol (**21**):

To a solution of dienyl sulfone **4** (822 mg, 3.29 mmol) in THF (30 mL) at -78 °C was slowly added MeLi in Et₂O (1.4M, 5.9mL, 8.22 mmol) over a period of 30 minutes using a syringe pump. The resulting orange solution was left stirring for 30 minutes to ensure complete reaction. After 30 minutes phenyl disulfide (1.8 g, 8.22 mmol) dissolved in THF (4 mL) was rapidly added *via cannula*. The temperature was allowed to rise to 25 °C and the reaction mixture was left stirring for 6 h. Saturated NH₄Cl (50 mL) was added to the mixture followed by Et₂O (100 mL). The aqueous phase was extracted with Et₂O (2 X 100 mL) and the combined organic extracts dried over MgSO₄ and concentrated. The product was purified via column chromatography using silica gel to give 835 mg of pure

21 in a 68 % yield. Further product may be obtained by heating the higher Rf mixture, diastereomers at the sulfone carbon, at reflux (~ 435 mg) in CH₂Cl₂ (10 mL) with a catalytic amount of DBU (0.05 mL) for 24 h. The mixture was washed with 5% HCl (1 X 5mL) and the organic layer is dried over Na₂SO₄ and concentrated. The product was purified via column chromatography using silica gel to give an additional 165 mg of **21**, giving a combined yield of 81 %. When the reaction was run on 12.1 g (48.4 mmol) the syringe pump was replaced by a pressure equalizing addition funnel, the final yield was 79% (14.2 g) after isomerization. ¹H NMR (300MHz, CDCl₃) δ 7.62-7.72 (m, 2H), 7.49-7.52 (m, 2H), 7.30-7.40 (m, 6H), 5.37 (d, *J* = 6.0Hz, 1H), 3.65-3.75 (m, 2H), 2.82-2.91 (m, 1H), 2.14-2.18 (m, 2H), 1.65-1.72 (m, 1H), 1.45-1.60 (m, 1H), 1.00 (d, *J* = 6.85 Hz, 3H). ¹³C NMR (75MHz, CDCl₃) δ 141.7, 138.5, 134.0, 133.7, 131.5, 129.4, 129.2, 128.7, 128.5, 115.8, 76.4, 65.8, 35.2, 29.8, 27.8, 7.8. LRMS (EI) *m/z*: 374 (M⁺); HRMS (CI) calculated for, C₂₀H₂₂O₃S₂, 375.1089; found 375.1088.

EXAMPLE 3

(1*R*, 2*R*)-(3-Benzenesulfonyl-2-methyl-5-phenylsulfanylcyclohept-4-enyloxy)-trimethylsilane (23): A solution of dienyl sulfone **13** (1.70 g, 5.27 mmol) in THF (60 mL) was cooled to -78 °C, and 4.2 mL (5.88 mmol) of MeLi (1.4 M in diethyl ether) was added dropwise over 30 min via syringe pump. The resulting orange solution was stirred at -78 °C for 15 min followed by addition of a solution of PhSSPh (1.80 g, 8.24 mmol) and THF (10 mL). The resulting mixture was slowly warmed up to room temperature over 6 h, and quenched with H₂O and diluted with EtOAc (30mL). The layers were separated, and the aqueous phase was extracted with EtOAc (2 X 30mL). The combined organic layers were washed with brine, then dried (Na₂SO₄) and concentrated via rotary evaporation. Column chromatography (EtOAc-hexane; 1:7) of the crude residue afforded 2.15 g (91%) of **23** as a 1:1 diastereomeric mixture. The two diastereomers can be separated by flash column chromatography (EtOAc-hexane; 1:10) for characterization, but were used as a mixture for the next reaction. Characterization data of two isomers:

23 α white solid, mp 114.5-116.5 °C; [α]_D²⁰ = +29.4° (c=0.77, CH₂Cl₂); ¹H NMR (CDCl₃, 300 MHz) δ 7.34-7.78 (m, 10H), 5.51 (d, *J* = 6.0 Hz, 1H), 3.69 (d, *J* = 6.0 Hz, 1H), 3.58 (m, 1H), 2.64 (m,

1H), 2.08-2.22 (m, 2H), 1.54 (m, 2H), 0.98 (d, $J = 6.9$ Hz, 3H), 0.063 (s, 9H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 141.5, 138.9, 134.1, 133.9, 132.0, 129.7, 129.4, 128.9, 116.6, 77.3, 66.2, 36.1, 30.3, 29.0, 7.9, 0.26; LRMS (CI): m/z 447 $[\text{M}+\text{H}]^+$; HRMS (CI) calculated for $\text{C}_{23}\text{H}_{30}\text{O}_3\text{S}_2\text{Si}$, 446.1406; found, 446.1390.

23 β light yellow oil; $[\alpha]_D^{20} = -36.8^\circ$ ($c=0.93$, CH_2Cl_2); ^1H NMR (CDCl_3 , 300 MHz) δ 7.29-7.86 (m, 10H), 4.83 (d, $J = 8.7$ Hz, 1H), 4.61 (dt, $J = 10.8, 3.9$ Hz, 1H), 3.64 (dd, $J = 8.7, 3.9$ Hz, 1H), 2.94-3.04 (m, 2H), 2.17-2.25 (m, 1H), 1.63-1.83 (m 2H), 1.05 (d, $J = 7.2$, 3H), 0.22 (s, 9H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 148.2, 140.1, 133.9, 133.6, 132.4, 129.5, 129.3, 128.7, 113.6, 72.0, 69.3, 36.1, 30.4, 29.6, 12.6, 0.41; LRMS (CI): m/z 447 $[\text{M}+\text{H}]^+$; HRMS (CI) calculated for $\text{C}_{23}\text{H}_{30}\text{O}_3\text{S}_2\text{Si}$, 446.1406; found, 446.1398.

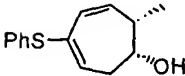

EXAMPLE 4

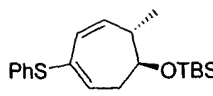

(1*R*, 2*S*)-3-Benzenesulfonyl-2-methyl-5-phenylsulfanylcyclohept-4-enyloxy)-*tert*-butyldimethylsilane (22): A solution of dienyl sulfone **5** (437 mg, 1.20 mmol) in THF (15 mL) was cooled to -78°C , and MeLi (1.4 M in diethyl ether, 2.21 mL, 3.08 mmol) was slowly added. The resulting orange solution was stirred at -78°C for 30 min followed by addition (*via cannula*) of a solution of $(\text{PhS})_2$ (537 mg, 2.46 mmol) in THF (5 mL). The resulting mixture was slowly warmed up to room temperature over 12 h, then quenched with H_2O and diluted with EtOAc (30 mL). The layers were separated, and the aqueous phase was extracted with EtOAc (2 X 30 mL). The combined organic layers were washed with brine, then dried (Na_2SO_4) and concentrated. Flash column chromatography (EtOAc-hexanes; 1:10) of the crude residue afforded 453 mg (77%) of a 2:1 diastereomeric mixture at the sulfone position, of **22** as a yellow oil. ^1H NMR (CDCl_3 , 300 MHz) δ 7.29-7.73 (m, 10H), 5.36 (m, 1H), 4.55 (d, $J = 6.1$ Hz, 1H), 3.84 (br t, $J = 7.8$ Hz, 1H), 2.48-2.86 (m, 2H), 1.67-1.78 (m, 2H), 1.43 (m, 1H), 1.06 (d, $J = 7.0$ Hz, 3H), 0.87 (s, 9H), -0.013 (s, 6H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 133.7, 133.4, 129.3, 129.1, 128.5, 117.4, 117.3, 73.1, 62.8,

36.1, 27.4, 26.4, 25.8, 17.9, 12.6, -5.00, -5.04.; LRMS(CI): m/z 489 $[M+H]^+$, 143 m/z [Base]; HRMS(CI) calculated for $C_{26}H_{36}O_3S_2Si$ 489.1953; found 489.1951.

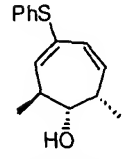

EXAMPLE 5

 **(1R, 2S)-2-Methyl-5-phenylsulfanylcyclohepta-3, 5-dienol (29): 22** or **23** (2.15 g, 4.81 mmol) was dissolved in dry methylene chloride (20 mL), and 4.0 mL of Et_3N (28.7 mmol) was added at room temperature, followed by addition of 3.0 mL (16.6 mmol) of TMSOTf. This mixture was brought to reflux under N_2 , and stirred for 8 h until the starting material was consumed (monitored by TLC using 30% ethyl acetate in hexanes). The reaction mixture was cooled to 0 °C, and the excess TMSOTf was quenched by adding MeOH (1.0 mL, 24.7 mmol), diluted with EtOAc (20 mL), separated, and the aqueous layer was extracted with EtOAc (2 X 20 mL). The combined organic layers were concentrated via rotary evaporation, dissolved in a mixture of THF (30 mL) and H_2O (10 mL). 10 mL of AcOH were added to the mixture and left stirring at room temperature for 3 h. It was then transferred to a 1 L beaker and saturated aqueous $NaHCO_3$ was carefully added until the solution became slightly basic, copious CO_2 evolved during this process. The organic layer was separated, and the aqueous layer was extracted with EtOAc (3 X 50 mL). The combined organic layers were washed by saturated $NaHCO_3$, followed by brine, and dried over Na_2SO_4 . Flash column chromatography (EtOAc-hexane; 1:4) afforded 0.97 g (86%) of **29** as an oil. Care must be taken during purification that the mixture not be exposed to silica for extended time since this will cause some decomposition. The product slowly decomposes at 25 °C, but stores well at -10 °C. $[\alpha]_D^{20} = +200.5$ ($c=0.55$, CH_2Cl_2); 1H NMR ($CDCl_3$, 300 MHz) δ 7.20-7.33 (m, 5H), 6.27 (t, $J = 5.4$ Hz, 1H), 5.92 (d, $J = 11.4$ Hz, 1H), 5.69 (dd, $J = 4.8$, 11.4 Hz, 1H), 4.17 (br s, 1H), 2.59-2.68 (m, 2H), 2.42-2.52 (m, 1H), 1.97 (br s, 1H), 1.22 (d, $J = 7.2$ Hz, 3H); ^{13}C NMR ($CDCl_3$, 75 MHz) δ 137.2, 136.1, 133.9, 131.5, 129.9, 129.5, 129.2, 126.7, 76.4, 40.8, 38.3, 16.7; LRMS (CI): m/z 233 $[M+H]^+$; HRMS (CI) calculated for $C_{14}H_{17}OS$, 233.1000; found, 233.0991.

EXAMPLE 6

(1R,2R)-tert-Butyldimethyl-(2-methyl-5-phenylsulfanylcyclohepta-3,5-dienyloxy)-silane (27): To vinyl sulfide **22** (400 mg, 0.819 mmol) in CH₂Cl₂ (10 mL) was added Et₃N (0.67 mL, 4.92 mmol) followed by TMSOTf (0.74 mL, 4.10 mmol). The stirred mixture was heated to reflux for 8 h at which point all starting material has been consumed. The solution was allowed to cool to 25 °C and isopropyl alcohol was added (3 mL). The reaction was then concentrated the residue was purified by filtering through a 1 inch silica plug, eluting with 30% ethyl acetate in hexanes and collecting in separate fractions giving 269 mg of sulfide **27** (5:1 mixture) in 95% yield. Care must be taken during purification that the mixture not be exposed to silica for extended time since this will cause some decomposition. The product slowly decomposes at 25 °C, but stores well at -10 °C. ¹H NMR (CDCl₃, 300 MHz) δ 7.15- 7.27 (m, 5H), 6.38 (t, J = 6.4 Hz, 1H), 5.73 (m, 2H), 3.85 (dt, J = 4.6 Hz, 8.1 Hz, 1H), 2.37 (m, 3H), 1.10 (d, J = 7.0 Hz), 0.91 (s, 9H), 0.083 (s, 3H), 0.071(s, 3H); ¹³C NMR (CDCl₃, 75 MHz) δ 138.7, 138.6, 136.4, 135.2, 132.1, 129.3, 129.2, 128.8, 128.6, 126.0, 81.1, 43.7, 38.0, 25.8, 18.8, 18.0, -4.4, -4.7. LRMS (CI): *m/z* 347 [M+H]⁺; HRMS (CI) calculated for C₂₀H₃₀OSSi, 346.1865; found, 346.1861.

EXAMPLE 7

(1S, 2S, 7S)-2,7-Dimethyl-4-phenylsulfanylcyclohepta-3,5-dienol (31): A solution of alcohol **29** (887 mg, 3.82 mmol) in THF (50 mL) was cooled to -78 °C, and 3.20 mL of n-BuLi (2.5 M in hexanes, 8.00 mmol) was added dropwise. The mixture was slowly brought to -7 °C over 1 h, and stirred at this temperature for 10 min. It was then cooled to -100 °C in a THF-liquid N₂ bath. To this cold dark orange solution was slowly added a solution of MeI (0.72 mL, 11.56 mmol) in THF (5 mL) over 30 min via syringe pump. The resulting light yellow solution was warmed to -60 °C prior to quenching with saturated aqueous NH₄Cl. After warming to room temperature, the two layers were separated, and the aqueous layer was extracted with EtOAc (3 × 30 mL). The combined organic layers were washed with brine, and dried over Na₂SO₄. Flash column chromatography (EtOAc/hexanes; 1:4) afforded 660 mg (70% yield) of **31** as a white solid. mp 81.5-83.5 °C; [α]_D²⁰ = +407.8 (c=0.55,

CH₂Cl₂); ¹H NMR (CDCl₃, 300 MHz) δ 7.20-7.35 (m, 5H), 6.27 (d, *J* = 5.4 Hz, 1H), 5.98 (br d, *J* = 10.8 Hz, 1H), 5.75 (dd, *J* = 4.5 Hz, 10.8 Hz), 3.79 (dd, *J* = 2.7 Hz, 6.0 Hz, 1H), 2.55 (m, 1H), 2.45 (m, 1H), 1.65 (br s, 1H), 1.25 (d, *J* = 7.5 Hz, 3H), 1.20 (d, *J* = 6.9 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz) δ 140.9, 138.7, 136.1, 130.5, 130.2, 129.9, 129.2, 126.7, 84.7, 43.5, 38.1, 19.4, 17.6; Analytical. Calculated for C₁₅H₁₈OS: C, 73.13; H, 7.36. Found: C, 72.42; H, 7.22.

EXAMPLE 8

(1*S*, 2*S*, 7*S*)-4-Benzenesulfonyl-2,7-dimethylcyclohepta-3,5-dienol (32):

A solution of dienylyl sulfide **31** (600 mg, 2.43 mmol) in CH₂Cl₂ (25 mL) was cooled to 0 °C, and 1.3 g of *m*-CPBA (5.34 mmol based on 70% content) was added in 2 portions. The mixture was stirred at 0 °C for 1h, and at room temperature for 10 min. The excess *m*-CPBA was quenched with aqueous NaHSO₃. The resulting two layers were separated, and the aqueous phase was extracted with CH₂Cl₂ (3 × 20 mL). The combined organic extracts were washed with saturated aqueous Na₂CO₃, dried over Na₂SO₄ and concentrated. The residue was purified by flash column chromatography (EtOAc/hexanes; 50:50) to afford 630 mg (93%) of sulfone **32** as a white solid. mp 100.0-101.5 °C; [α]_D²⁰ = +272.3 (c=0.51, CH₂Cl₂); ¹H NMR (CDCl₃, 300 MHz) δ 7.76-7.90 (m, 2H), 7.53-7.70 (m, 3H), 7.19 (d, *J* = 5.4 Hz, 1H), 6.23 (br d, *J* = 11.4 Hz, 1H), 5.86 (dd, *J* = 4.5 Hz, 11.4 Hz, 1H) 3.73 (d, *J* = 5.4 Hz, 1H), 2.70 (m, 1H), 2.38 (m, 1H), 1.56 (br s, 1H) 1.24 (d, *J* = 7.2 Hz, 3H), 1.19 (d, *J* = 7.5 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz) δ 144.1, 141.8, 140.0, 138.5, 133.6, 129.5, 127.9, 120.2, 81.7, 42.2, 38.1, 19.0, 16.9; Analytical. Calculated for C₁₅H₁₈O₃S: C, 64.72; H, 6.52. Found: C, 64.63; H, 6.47.

EXAMPLE 9

(1*S*, 2*S*, 7*S*)-(4-Benzenesulfonyl-2,7-dimethylcyclohepta-3,5-

dienyloxy)-*tert*-butyldimethylsilane (33): A solution of alcohol **32** (550 mg, 1.98 mmol) and 2,6-lutidine (0.34 mL, 2.97 mmol) in CH₂Cl₂ (20 mL)

was cooled to $-78\text{ }^{\circ}\text{C}$, and 0.55 mL (2.39 mmol) of TBSOTf was added. The cold solution was stirred and allowed to warm to $0\text{ }^{\circ}\text{C}$ over a 1 h. MeOH (40 μL , 1 mmol) was then added and the resulting mixture was concentrated via rotary evaporation. The crude residue was purified with flash column chromatography (EtOAc/hexanes; 1:5) to afford 760 mg (98%) of **33** as colorless oil. $[\alpha]_{\text{D}}^{20} = +126.7$ ($c=0.80$, CH_2Cl_2); ^1H NMR (CDCl_3 , 300 MHz) δ 7.86-7.90 (m, 2H), 7.50-7.64 (m, 3H), 7.09 (d, $J = 5.4$ Hz, 1H), 6.06 (dt, $J = 11.7$ Hz, 1.5 Hz, 1H), 5.80 (dd, $J = 11.7$ Hz, 5.1 Hz, 1H), 3.66 (dd, $J = 6.3$ Hz, 2.1 Hz, 1H), 2.70 (m, 1H), 2.47 (m, 1H), 1.18 (d, $J = 7.2$ Hz, 3H), 1.06 (d, $J = 7.2$ Hz, 3H), 0.81 (s, 9H), 0.038 (s, 3H), 0.032 (s, 3H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 142.8, 140.4, 140.2, 137.8, 133.2, 129.3, 128.0, 118.4, 76.8, 41.4, 38.8, 26.0, 19.1, 18.2, 16.7, -4.1, -4.4; LRMS (CI): m/z 393 $[\text{M}+\text{H}]^+$; HRMS (CI) calculated for $\text{C}_{21}\text{H}_{32}\text{O}_3\text{SSi}$, 392.1841; found, 392.1840.

EXAMPLE 10

(1S, 2R, 7S)-2-Dimethylaminomethyl-7-methyl-4-

phenylsulfanylcyclohepta-3,5-dienol (**34**): A solution of alcohol **29** (80

mg, 0.34 mmol) in THF (4 mL) was cooled to $-78\text{ }^{\circ}\text{C}$, and 0.30 mL of *n*-

BuLi (2.5 M in hexanes, 0.75 mmol) was added dropwise via syringe. This mixture was brought to $-7\text{ }^{\circ}\text{C}$ over 1 h, and stirred at $-7\text{ }^{\circ}\text{C}$ for 10 min, then cooled to $-78\text{ }^{\circ}\text{C}$, and transferred to a flask containing *N,N*-dimethylmethyleammonium iodide

(Eschenmoser's salt, 160 mg, 0.86 mmol) in THF (4 mL) *via cannula*. The resulting suspension was warmed to room temperature over 2 h, then saturated aqueous NaHCO_3 (5 mL) was added, the organic layer was separated, and the aqueous layer was extracted with EtOAc (3×5 mL). The combined organic layers were washed with brine, and dried (Na_2SO_4). Flash column chromatography ($\text{CH}_2\text{Cl}_2/\text{MeOH}$; 10:1) afforded 58 mg (58% yield) of **34** as a light yellow oil. ^1H NMR (CDCl_3 , 300 MHz) δ 7.20-7.38 (m, 5H), 6.11 (dd, $J = 10.5$ Hz, 6.3 Hz, 1H), 5.89-5.96 (m, 2H), 4.20 (dd, $J = 8.4$ Hz, 4.2 Hz, 1H), 2.79

(t, $J = 12.6$ Hz, 1H), 2.45-2.55 (m, 3H), 2.31 (s, 6H), 2.24-2.28 (m, 1H), 1.19 (d, $J = 7.2$ Hz, 3H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 142.0, 135.6, 134.5, 133.7, 130.3, 129.5, 129.1, 126.9, 89.3, 64.9, 45.9, 43.5, 39.4, 23.9, 14.6.

EXAMPLE 11

(1*S*, 7*S*)-4-Benzenesulfonyl-7-methyl-2-methylenecyclohepta-3,5-

dienol (35): To a solution of amine **34** (42 mg, 0.14 mmol) in CH_2Cl_2 (2 mL) was added 140 mg of *m*-CPBA (0.57 mmol based on 70% content).

The mixture was stirred at room temperature for 30 min, then aqueous NaHSO_3 was added, the resulting two layers were separated, and the aqueous phase was extracted with CH_2Cl_2 (3×3 mL). The combined organic layers were washed with saturated aqueous Na_2CO_3 , dried with Na_2SO_4 , and concentrated. The residue was purified by flash column chromatography (EtOAc/hexanes; 1:2) to afford 36 mg (91%) of trienyl sulfone **35**. ^1H NMR (CDCl_3 , 300 MHz) δ 7.88-7.92 (m, 2H), 7.54-7.67 (m, 3H), 7.51 (s, 1H), 6.24 (dt, $J = 11.4$ Hz, 1.2 Hz, 1H), 5.90 (dd, $J = 11.4$ Hz, 5.4 Hz, 1H), 5.78 (s, 1H), 5.72 (s, 1H), 4.36 (s, 1H), 2.64 (m, 1H), 1.81 (br s, 1H), 1.11 (d, $J = 7.5$ Hz, 3H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 145.6, 140.2, 139.3, 137.0, 136.1, 133.6, 129.5, 128.1, 128.0, 120.2, 75.1, 39.3, 16.4.

EXAMPLE 12

(1*R*, 2*R*, 3*R*, 4*S*, 7*R*)-6-Benzenesulfonyl-2,4-dimethyl-8-

oxabicyclo[5.1.0]oct-5-en-3-ol (α 36): A suspension of dienyl sulfone **32** (67 mg, 0.24 mmol), molybdenum hexacarbonyl (3 mg, 0.01 mmol), and

tert-butylhydroperoxide (74 μL of 5 M solution in decane) in benzene (3 mL) was heated at 80 $^\circ\text{C}$ for 10 h. The reaction mixture was concentrated via rotary evaporation, purified by flash column chromatography (ethyl acetate/hexanes; 50:50) to afford 62 mg (88% yield) of epoxide α 36 as a light yellow solid. mp 137.0-139.0 $^\circ\text{C}$; $[\alpha]_D^{20} = +59.3$ ($c = 0.51$, CH_2Cl_2); ^1H NMR (CDCl_3 , 300 MHz) δ 7.93-7.96 (m, 2H), 7.58-7.70 (m, 3H), 7.39 (d, J

= 7.2 Hz, 1H), 3.90 (dd, J = 4.5 Hz, 1.5 Hz, 1H), 3.64 (br s, 1H), 3.42 (m, 1H), 3.05-3.15 (m, 2H), 2.55 (tq, J = 2.1 Hz, 7.2 Hz, 1H), 1.39 (d J = 7.2 Hz, 3H), 1.18 (d, J = 7.5 Hz, 3H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 147.9, 139.7, 136.5, 133.9, 129.7, 128.2, 78.3, 65.5, 52.5, 41.5, 32.2, 17.4, 17.2; Analytical. EXAMPLE 18

(1*S*, 2*S*, 3*R*)-Acetic acid 3-benzenesulfonyl-2-methyl-5-

oxocycloheptylester (41): To a solution of **21** (4.63 g, 12.38 mmol) in

dichloromethane (62 mL) was added acetic anhydride (1.40 mL, 14.9

mmol), triethylamine (2.61 mL, 18.6 mmol), and a catalytic amount of *N,N*-dimethylaminopyridine. The solution was stirred for 30 minutes at room temperature, diluted with dichloromethane (60 mL), washed with water (100 mL) and 5% HCl solution (100 mL). The organic layer was washed with a saturated NaHCO₃ solution (100 mL), dried over MgSO₄, and concentrated to give a light yellow oil. To a heterogeneous mixture of HgCl₂ (6.72 g, 24.8 mmol) and sodium iodide (5.53 g, 37.1 mmol) in acetonitrile (180 mL) was added chlorotrimethylsilane (4.71 mL, 37.1 mmol) at room temperature, followed by the addition of water (0.67 mL, 37.1 mmol). After 5 min, a solution of acetylated compound of **21** in acetonitrile (120 mL) was added. The reaction was allowed to stir at room temperature for 16 h. The contents of the reaction were filtered through a pad of celite. The filtrate was treated with water (500 mL) and the product extracted with diethyl ether. The combined organic extracts were washed with brine, dried over MgSO₄, and concentrated. The product was purified via flash column chromatography using silica gel to give **41** (3.41 g, 85%). ¹H NMR (300 MHz,

CDCl₃) δ 7.89 (d, J = 7.2 Hz, 2H), 7.69 (t, J = 7.5 Hz, 1H), 7.59 (t, J = 7.2 Hz, 2H), 4.84 (m, 1H), 3.51 (dd, J = 12.9 Hz, 4.2 Hz, 1H), 3.00 (m, 1H), 2.88 (dd, J = 17.7 Hz, 12.9 Hz, 1H), 2.67 (dd, J = 17.7, 4.5 Hz, 1H), 2.41 (m, 2H), 2.02 (s, 3H), 1.90 (m, 1H), 1.71 (m, 1H), 1.00 (d, J = 7.2 Hz, 3H); ¹³C NMR (75 MHz, CDCl₃) δ 207.0, 169.6, 137.0, 134.2, 129.5, 128.7, 75.8, 60.8, 38.9, 33.9, 24.6, 21.0, 7.3; LRMS (CI) m/z 325 (M+H), 265 (M+H-AcOH).

EXAMPLE 19

(1E, 3Z, 5R, 6S)-2-(tert-Butyldimethylsilyloxy)-5-methyl-6-triisopropylsilyloxycyclohepta-1,3-diene (42): To a solution of **41** (3.10 g, 9.57 mmol) in toluene (64 mL) was added DBU (1.60 g, 10.53 mmol) at room temperature. The solution was stirred for 2 h and then washed with water (10 mL) and brine (10 mL). The organic layer was dried over MgSO₄ and concentrated. The resulting oil was dissolved in methylene chloride (32 mL) and diisopropylethylamine (1.48 g, 11.48 mmol) and *tert*-butyldimethylsilyl trifluoromethanesulfonate (2.78 g, 10.5 mmol) were added at 0 °C. The solution was stirred for 1 h at room temperature. The reaction mixture was concentrated and then treated with 1M KOH in methanol (50 mL) for 10 min at room temperature followed by treatment with saturated ammonium chloride solution. The product was extracted with diethyl ether and the combined organic extracts were washed with brine, dried over MgSO₄, and concentrated. The colorless crude oil was dissolved in dichloromethane (50 mL) and triethylamine (1.45 g, 14.4 mmol) and triisopropylsilyl trifluoromethanesulfonate (3.23 g, 10.5 mmol) were added at 0 °C. The solution was stirred for 1 h at room temperature and then washed with water (2 X 50 mL), dried over MgSO₄, and concentrated. The product was purified via column chromatography using silica gel column to give **42** (2.67 g, 68%) as an oil. ¹H NMR (300 MHz, CDCl₃) δ 5.75 (dd, J = 12.3 Hz, 6.6 Hz, 1H), 5.63 (dd, J = 12.3 Hz, 1.8 Hz, 1H), 5.04 (m, 1H), 4.16 (m, 1H), 2.60 (m, 1H), 2.41 (m, 1H), 2.29 (m, 1H), 1.09 (br s, 24H), 0.96 (s, 9H), 0.15 (s, 3H), 0.14 (s, 3H); ¹³C NMR (75 MHz, CDCl₃) δ 148.4, 135.0, 126.8, 107.2, 73.9, 42.0, 32.0, 25.8, 18.2, 18.1, 13.8, 12.5, -4.4, -4.5; LRMS (CI) m/z 411 (M+H); HRMS (EI) m/z 410.3023 (410.3036 calculated for C₂₃H₄₆O₂Si₂, M⁺).

EXAMPLE 20

(1*R*, 2*R*, 3*S*, 5*S*, 8*E*)-9-(*tert*-Butyldimethylsilyloxy)-2-methyl-3-triisopropylsilyloxy-6,7-dioxabicyclo[3.2.2]-non-8-ene (42)

(1.15 g, 2.80 mmol) was dissolved in dichloromethane (28 mL). A catalytic amount (17 mg) of 5,10,15,20-tetraphenyl-21*H*,23*H*-porphine (TPP) was added. The reaction mixture was cooled to -78 °C and was irradiated with a tungsten 75W broad-band lamp while bubbling O₂ through the reaction mixture. When the reaction was completed (TLC, R_f=0.72 EA/Hexanes 1:9, ca. 30 min), solvent was removed to give **43** (1.24 g), which was used in the next step without purification. ¹H NMR (300 MHz, CDCl₃) δ 5.22 (dd, *J* = 7.8 Hz, 2.1 Hz, 1H), 4.62 (dd, *J* = 7.8 Hz, 5.1 Hz, 1H), 4.36 (d, *J* = 6.0 Hz, 1H), 4.09 (m, 1H), 2.20 (m, 1H), 2.13 (m, 2H), 1.14 (d, *J* = 7.2 Hz, 1H), 1.08 (br s, 21H), 0.96 (s, 9H), 0.26 (s, 3H), 0.24 (s, 3H); ¹³C NMR (75 MHz, CDCl₃) δ 151.5, 98.2, 78.1, 77.4, 68.8, 41.6, 36.3, 26.1, 25.4, 18.1, 12.3, 9.1, -4.5, -5.0; LRMS (CI) *m/z* 443 (M+H); HRMS (EI) *m/z* 442.2925 (442.2935 calculated for C₂₃H₄₆O₄Si₂, M⁺).

EXAMPLE 21

(1*R*, 2*R*, 3*R*, 4*S*, 6*S*)-7-(*tert*-Butyldimethylsilyloxy)-2,3-dihydroxy-4-methyl-5-triisopropylsilyloxycycloheptanone (46):

To a solution of crude **43** (1.24 g, 2.80 mmol) in dichloromethane (5 mL) was added freshly prepared dimethyldioxirane solution in dichloromethane (ca. 0.1 M, 60 mL) at 0 °C. After the reaction mixture was stirred for 2 h at 0 °C, it was concentrated and then dissolved in methanol (28 mL). 5% Pd on carbon (1.20 g, 0.56 mmol) and sodium bicarbonate (0.47 g, 5.60 mmol) were added. The reaction mixture was stirred under hydrogen (1 atm) for 20 min at room temperature. After the reaction

mixture was diluted with dichloromethane (28 mL), it was filtered through a pad of celite, which was then washed with dichloromethane (50 mL). The combined filtrate was concentrated and the crude was purified by using a 1" pad of silica gel to give **46** (0.68 g, 53% overall from diene **42**). ^1H NMR (300 MHz, CDCl_3) δ 4.39 (t, $J = 6.9$ Hz, 1H), 4.28 (m, 2H), 4.03 (br s, 1H), 2.24 (t, $J = 6.9$ Hz, 2H), 2.12 (m, 1H), 1.11 (br s, 24H), 0.93 (s, 9H), 0.15 (s, 3H), 0.06 (s, 3H); ^{13}C NMR (75 MHz, CDCl_3) δ 208.1, 77.2, 74.0, 73.0, 72.6, 42.7, 40.9, 25.8, 18.5, 18.2, 18.1, 12.6, 12.5, -4.5, -5.4; LRMS (CI) m/z 461 (M+H); HRMS (CI) m/z 461.3112 (461.3119 calculated for $\text{C}_{23}\text{H}_{48}\text{O}_5\text{Si}_2$, M+H).

EXAMPLE 22

(1R, 2R, 3R, 4S, 6S)-7-(*tert*-Butyldimethylsilanyloxy)-2-hydroxy-3-methoxy-4-methyl-5-triisopropylsilanyloxycycloheptanone (**47**):

To a solution of **46** (0.62 g, 1.35 mmol) in freshly distilled dichloromethane (13 mL) was added a catalytic amount of dimethyltin dichloride (15 mg), followed by addition of potassium carbonate (0.93 g, 6.75 mmol). After stirring for 5 min at room temperature, the solution was cooled to 0 °C. Methyl trifluoromethanesulfonate (0.15 mL, 1.35 mmol) was added and the bath temperature was set to 17 °C to 20 °C. Additional stoichiometric amount of methyl trifluoromethanesulfonate was added every 1 h (up to total 5 equivalents). When all the starting material was consumed (TLC, ca. 8 h), saturated sodium bicarbonate solution was added. The product was extracted with dichloromethane (3 X 10 mL) and the organic layers were washed with water, dried over MgSO_4 , and concentrated. The product was purified by filtering through a 2 inch pad of silica gel to give **47** (0.56 g, 88%). ^1H NMR (300 MHz, CDCl_3) δ 4.41 (d, $J = 2.4$ Hz, 1H), 4.23 (m, 2H), 3.64 (t, $J = 3.0$ Hz, 1H), 3.49 (s, 3H), 2.42 (m, 1H), 2.33 (m, 1H), 1.98 (m, 1H), 1.11 (br s, 21H), 1.01 (d, $J = 7.2$ Hz, 3H), 0.94 (s, 9H), 0.16 (s, 3H), 0.07 (s, 3H); ^{13}C NMR (75 MHz, CDCl_3) δ 208.2, 83.6, 76.2, 74.3, 69.8, 60.2, 41.9, 39.7, 25.8, 18.4, 18.1, 12.4, 8.8, -4.4, -5.2; LRMS (CI) m/z 475 (M+H); HRMS (CI) m/z 475.3268 (475.3275 calculated for $\text{C}_{24}\text{H}_{50}\text{O}_5\text{Si}_2$, M+H).

EXAMPLE 23

(2*S*, 4*S*, 5*R*, 6*R*)-2-(*tert*-Butyldimethylsilanyloxy)-6-methoxy-5-methyl-7-oxo-4-triisopropylsilanyloxyheptanoic acid methyl ester

(48): To a solution of **47** (0.51 g, 1.08 mmol) in 1:1 ratio of dry MeOH-benzene (10 mL) were added pyridine (0.44 mL, 5.40 mmol) and

Pb(OAc)₄ (0.72 g, 1.62 mmol) at 0 °C. After the mixture was stirred for 1.5 h at 0 °C, saturated sodium bicarbonate solution (5mL) was added. The mixture was extracted with diethyl ether (3 X 10 mL) and the organic layers were washed with water, dried over MgSO₄, and concentrated. The product was purified by flash column chromatography to give **48** (0.46 g, 85%). ¹H NMR (300 MHz, CDCl₃) δ 9.64 (d, *J* = 3.0 Hz, 1H), 4.41 (dd, *J* = 7.8 Hz, 6.0 Hz, 1H), 4.21 (m, 1H), 3.76 (s, 3H), 3.57 (dd, *J* = 7.8 Hz, 3.3 Hz, 1H), 3.37 (s, 3H), 2.19 (m, 1H), 2.14 (m, 1H), 1.89 (m, 1H), 1.11 (br s, 21H), 1.00 (d, *J* = 7.2 Hz, 3H), 0.93 (s, 9H), 0.11 (s, 3H), 0.09 (s, 3H); ¹³C NMR (75 MHz, CDCl₃) δ 202.6, 173.9, 86.4, 70.5, 70.0, 58.1, 51.8, 39.3, 38.9, 25.7, 18.3, 17.7, 13.0, 11.7, -4.9, -5.2; LRMS (CI) *m/z* 505 (M+H); HRMS (CI) *m/z* 505.3388 (505.3381 calculated for C₂₅H₅₂O₆Si₂, M+H).

EXAMPLE 24

(1*R*, 5*S*, 6*R*, 7*S*)-3-Benzenesulfonyl-6-(*tert*-butyldimethylsilanyloxy)-5,7-dimethylcyclohept-3-enol (56**):** Compound **β37** (294 mg, 0.719

mmol) was dissolved in dry toluene (7.0 mL), and the temperature is

lowered to -78 °C, to this solution was added DIBAL-H (0.72 mL of 1.55 M in toluene) under nitrogen, stirred magnetically at -78 °C for 3 h. The reaction was quenched with 5% HCl aqueous solution, the mixture was extracted with ethyl acetate (3 X 5 mL). The organic layers were combined and washed with brine and dried over anhydrous Na₂SO₄. The crude reaction mixture was purified by flash column chromatography (ethyl acetate/hexanes 1:3) to afford 39 mg (13%) of 1,4-reduction compound **59** followed by 197 mg (67%) of compound **56** as a light yellow oil. [α]_D²⁰ = -32.9 (c=0.75, CH₂Cl₂); ¹H NMR (CDCl₃, 300 MHz) δ 7.88-7.92 (m, 2H), 7.55-7.68 (m, 3H), 7.05 (d, *J* = 5.4 Hz, 1H), 3.75 (dd, *J* = 6.9 Hz, 2.4 Hz, 1H), 3.61 (m, 1H), 2.72-2.82 (m, 2H), 2.52 (dd, *J* = 15.6 Hz, 7.2 Hz, 1H), 2.05 (dt, *J* = 2.4 Hz, 6.9 Hz, 1H), 1.77 (br s, 1H), 1.20 (d, *J* = 7.2

Hz, 3H), 1.07 (d, $J = 6.9$ Hz, 3H), 0.91 (s, 9H), 0.10 (s, 3H), 0.09 (s, 3H); ^{13}C NMR (CDCl_3 , 75 MHz) δ 145.2, 138.8, 137.8, 133.3, 129.2, 128.2, 73.9, 70.7, 43.7, 37.9, 31.7, 25.8, 18.0, 17.4, 14.8, -4.5, -4.8; LRMS (CI): m/z 411 $[\text{M}+\text{H}]^+$; HRMS (CI) calculated for $\text{C}_{21}\text{H}_{35}\text{O}_4\text{SSi}$, 411.2025; found, 411.2022.

EXAMPLE 51

(S)-4-Methylcyclohept-2-enone (27a). 90% yield. Conversion to enone required 3 days. Clear colorless oil. ^1H NMR (CDCl_3): δ 6.36 (ddd, $J = 12.2, 3.6, 0.8$ Hz, 1H), 5.96 (dd, $J = 12.2, 2.4$ Hz, 1H), 2.63 (m, 3H), 1.96 (m, 1H), 1.83 (m, 2H), 1.55 (m, 1H), 1.20 (d, $J = 7.2$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 204.42, 151.68, 130.61, 43.60, 35.65, 34.27, 21.88, 20.63. $[\alpha]_{\text{D}}^{25}$ (c 2.03, CHCl_3) = -94° .

General Procedure for generation of β -substituted enones via electrophile capture.

Following the general procedure for the conversion of β -methoxy vinyl sulfones to enones the orange anionic solution was quenched with 1.1 equivalents of the desired electrophile. The reaction decolorizes at -78°C after 15 min. A sat'd solution of NaHCO_3 was added followed by ether. The organic layer was dried over MgSO_4 and concentrated *in vacuo*. The residue was dissolved in CHCl_3 1mL/mmol and SiO_2 250 mg/mmol added. After 2 h the solution was filtered and the solvent removed *in vacuo*. The enones are typically 90-95% pure. Silica gel chromatography can be used if necessary.

HMPA modified procedure for generation of β -substituted enones via electrophile capture.

1.2 equiv. of *t*-BuLi (0.61 mmol) were added to the mixture of β -methoxy vinyl sulfone (0.51 mmol) and HMPA (2.5 mmol) in 20 mL THF at -78°C over 2 min. The resulting dark orange reaction was stirred at this temperature for 10 min. The solution was quenched with 3.1 equivalents of the desired electrophile. The reaction decolorizes at -78°C after 15 min. A sat'd solution of NaHCO_3 was added followed by ether. The organic layer was dried over MgSO_4 and concentrated *in vacuo*. The residue was dissolved in CHCl_3 1mL/mmol and SiO_2 250 mg/mmol added. After 3 h the solution was filtered and the solvent removed *in vacuo*. The enones are typically 90-95% pure. Silica gel chromatography can be used if necessary

General procedure for the oxidation of γ -hydroxy vinyl sulfones.

2 mmol of γ -hydroxy vinyl sulfone was dissolved in 100 mL ether. Activated MnO_2 was added portionwise with rapid stirring until the reaction was complete as determined by

TLC. The reaction was filtered through a 1:1 mixture of celite and SiO₂. The resulting enones did not require purification and were routinely used crude.

General Procedure for generation of β -substituted enones via addition/elimination.

Alkyl cuprates, prepared as above, were added to β -sulfonyl-enones at -78°C in THF. The reactions were allowed to warm slowly to room temperature overnight. Ether and water were added to the reactions. The organic layer was dried and concentrated *in vacuo*. SGC, 8:2, Hex:EA, provided the desired enones in the yields indicated with the remaining mass recovered as unreacted starting material.

(S)-3-Benzenesulfonyl-4-methylcyclohex-2-enone (17aa). 92% yield. Clear colorless oil. ¹H NMR (CDCl₃): δ 7.95 (m, 2H), 7.69 (m, 3H), 6.57 (s, 1H), 2.93 (m, 1H), 2.63 (ddd, J = 18.7, 13.6, 5.2 Hz, 1H), 2.44 (dt, J = 17.9, 3.8 Hz, 1H), 2.09 (m, 1H), 1.94 (m, 1H), 1.33 (d, J = 6.4 Hz, 3H). ¹³C NMR (CDCl₃): δ 197.78, 163.83, 137.82, 134.35, 130.00, 129.54, 128.66, 32.86, 30.13, 28.50, 18.19. LRMS: (EI) 250 (highest mass) 81 (base peak). (CI) 251 (M+H). HRMS: calculated for C₁₃H₁₄O₃S 250.0664, found 250.0660. $[\alpha]_D$ (c 5.19, CHCl₃) = -11°.

(R)-3-Benzenesulfonyl-4-isopropylcyclohex-2-enone (17ba). 91% yield. Clear colorless oil. ¹H NMR (CDCl₃): δ 7.95 (m, 2H), 7.68 (m 3H), 6.61 (m, 1H), 2.82 (m, 1H), 2.65-2.30 (m, 3H), 2.20 (m, 1H), 1.92 (m, 1H), 1.12 (d, J = 6.9 Hz, 3H), 0.89 (d, J = 6.9 Hz, 3H). ¹³C NMR (CDCl₃): δ 198.14, 162.75, 138.33, 134.25, 131.89, 129.50, 128.60, 39.38, 34.81, 30.29, 22.92, 21.55, 18.79. (S)-3,4-Dimethylcyclohex-2-enone (14aa). 92% yield. Clear colorless oil. ¹H NMR (CDCl₃): δ 5.80 (t, J = 1.2 Hz, 1H), 2.50-2.20 (m, 3H), 2.10 (m, 1H), 1.75 (m, 1H), 1.18 (d, J = 7.1 Hz, 3H). ¹³C NMR (CDCl₃): δ 199.60, 166.59, 126.26, 34.48, 34.29, 30.24, 22.66, 17.66. $[\alpha]_D$ (c 0.51, CHCl₃) = +106°.

(S)-3-Allyl-4-methylcyclohex-2-enone (14ba). 96% allyl bromide capture. Clear, light yellow oil. ¹H NMR (CDCl₃): δ 5.86 (s, 1H), 5.83 (m, 1H), 5.19 (m, 2H), 3.00 (d, J = 7.0 Hz, 2H),

2.53 (m, 2H), 2.36 (m, 1H), 2.16 (m, 1H), 1.83 (m, 1H), 1.24 (d, $J = 7.2$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 199.41, 167.93, 133.52, 125.68, 118.11, 39.80, 34.12, 32.84, 30.10, 17.53. LRMS: (EI) 150 (highest mass) 79 (base peak). (CI) 151 (M+H). HRMS: calculated for $\text{C}_{10}\text{H}_{14}\text{O}$ 150.1045, found 150.1043. $[\alpha]_{\text{D}}$ (c 1.40, CHCl_3) = -153° .

(S)-3-Isopropyl-4-methylcyclohex-2-enone (14ca). 45% yield, *i*-PrCu(CN)Li addition. Clear colorless oil. ^1H NMR (CDCl_3): δ 5.87 (m, 1H), 2.53 (m, 2H), 2.34 (dt, $J = 17.4, 5.1$ Hz, 1H), 2.12 (m, 1H), 1.84 (m, 1H), 1.24 (d, $J = 6.9$ Hz, 3H), 1.15 (d, $J = 6.6$ Hz, 3H), 1.13 (d, $J = 6.6$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 200.09, 176.52, 122.43, 33.64, 32.93, 32.38, 30.26, 22.30, 20.68, 17.89. LRMS: (EI) 152 (highest mass) 109 (base peak). (CI) 153 (M+H). HRMS: calculated for $\text{C}_{10}\text{H}_{16}\text{O}$ 152.1201, found 152.1199. $[\alpha]_{\text{D}}$ (c 0.43, CHCl_3) = $+119^\circ$.

(R)-4-Isopropyl-3-methylcyclohex-2-enone (14da). 90% yield MeI capture, 60% yield MeCu(CN)Li addition. Clear colorless oil. ^1H NMR (CDCl_3): δ 5.95 (m, 1H), 2.48 (ddd, $J = 17.1, 7.2, 5.1$ Hz, 1H), 2.27 (m, 2H), 2.00 (m, 1H), 1.99 (m, 3H), 1.93 (m, 2H), 1.06 (d, $J = 6.9$ Hz, 3H), 0.86 (d, $J = 6.9$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 200.32, 165.75, 128.86, 45.94, 36.51, 29.18, 23.82, 22.61, 21.92, 18.38. 93% ee HPLC Chiralcel AD 1.0 mL/min 97.5:2.5 Hex:2-propanol. 7.68 min. minor enantiomer, 8.36 min. major enantiomer.

(4S)-3-Allyl-4-isopropylcyclohex-2-enone (14ea). Using HMPA, 92% yield allyl bromide capture. Clear colorless oil. ^1H NMR (CDCl_3): δ 5.92 (m, 1H), 5.77 (m, 1H), 2.98 (d, $J = 6.9$ Hz, 2H), 2.47 (m, 1H), 2.22 (m, 3H), 1.94 (m, 2H), 1.03 (d, $J = 6.7$ Hz, 3H), 0.87 (d, $J = 6.9$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 199.75, 166.74, 133.85, 127.47, 43.83, 40.49, 35.46, 28.83, 22.43, 21.47, 18.39. LRMS: (EI) 178 (highest mass) 135 (base peak). HRMS: calculated for $\text{C}_{12}\text{H}_{18}\text{O}$ 178.1358, found 178.1354. $[\alpha]_{\text{D}}$ (c 6.80, CHCl_3) = -69° .

(4R)-3-Butyl-4-isopropylcyclohex-2-enone (14ga). Using HMPA, 84% yield butyl iodide capture. Clear colorless oil. ^1H NMR (CDCl_3): δ 5.91 (m, 1H), 2.46 (m, 1H), 2.20 (m, 5H), 1.93 (m, 2H), 1.42 (m, 4H), 1.03 (d, $J = 6.7$ Hz, 3H), 0.92 (t, $J = 7.2$ Hz, 3H), 0.86 (d, $J = 6.7$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 199.93, 169.32, 126.64, 43.90, 36.70, 35.47, 29.85, 28.98, 22.48,

21.51, 18.46, 13.85. LRMS: (EI) 194 (highest mass) 110 (base peak). HRMS: calculated for $C_{13}H_{22}O$ 194.1671, found 194.1675. $[\alpha]_D$ (c 5.8, $CHCl_3$) = -12° .

(R)-4-Isopropyl-2-methylcyclohex-2-enone (19a). 3 equivalents of MeLi (1.5 mmol) were added to 140 mg (0.5 mmol) **12t-iPr** in 20 mL THF at $-78^\circ C$. After 1 h, ether and water were added to the reaction. The organic layer was dried over $MgSO_4$ and concentrated *in vacuo*. The residue was dissolved in 20 mL of acetone and cooled to $0^\circ C$. Jones reagent was added until an orange color persisted. Several drops of 2-propanol were added to bring the reaction back to green. The entire contents of the flask were filtered through a plug of fluorosil and the solvent was removed *in vacuo*. The residue was dissolved in 20 mL of $CHCl_3$ and 0.76 g (0.5 mmol) of DBU was added and the reaction heated to reflux for 2 h. The solvent was removed *in vacuo*. The crude material was loaded directly onto silica. SGC, 8:2, Hex:EA, provided **19** as a clear colorless liquid. 57 mg 75% yield. 1H NMR ($CDCl_3$): δ 6.68 (m, 1H), 2.56 (dt, $J = 16.6, 4.3$ Hz, 1H), 2.33 (m, 2H), 2.00 (m, 1H), 1.81 (dd, $J = 2.4, 1.4$ Hz, 3H), 1.76 (m, 2H), 0.99 (d, $J = 6.7$ Hz, 3H), 0.97 (d, $J = 6.7$ Hz, 3H). ^{13}C NMR ($CDCl_3$): δ 200.35, 149.45, 135.45, 42.82, 37.61, 31.70, 25.62, 19.64, 19.40, 16.10. 91.2% ee HPLC Chiralcel AD 1.0 mL/min 99:1 Hex:2-propanol. 5.79 min. minor enantiomer, 6.49 min. major enantiomer.

(4R)-4-Isopropyl-2,3-dimethylcyclohex-2-enone (21a). 3 equivalents of MeLi (1.65 mmol) were added to a mixture of 157 mg (0.55 mmol) of **12t-iPr** and HMPA (0.48 mL, 2.75 mmol) in 6 mL THF at $-78^\circ C$. After 30 min, methyl iodide (0.17 mL, 2.75 mmol) was added and the temperature is allowed to rise to $-30^\circ C$. Ether (10 mL) and water (5 mL) were added to the reaction and the mixture was then extracted. The organic layer was dried over $MgSO_4$ and concentrated *in vacuo*. The residue was dissolved in 10 mL of acetone and cooled to $0^\circ C$. Jones reagent was added until an orange color persisted. Several drops of 2-propanol were added to bring the reaction back to green. The entire contents of the flask were filtered through a plug of fluorosil and the solvent was removed *in vacuo*. The residue was dissolved in 20 mL of $CHCl_3$ and 0.123 mL (0.83 mmol) of DBU were added and the reaction heated to reflux for 2 h. The solvent was removed *in vacuo*. The crude material was loaded directly onto silica. SGC,

8:2, hexane:ethyl acetate, provided **21** as a clear colorless liquid. 83.7 mg 92% yield. ^1H NMR (CDCl_3): δ 2.50 (m, 1H), 2.29 (m, 1H), 2.14 (m, 2H), 1.90 (m, 9H), 1.02 (d, $J = 6.6$ Hz, 3H), 0.85 (d, $J + 6.6$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 199.01, 158.04, 132.11, 46.86, 35.24, 29.44, 22.15, 21.51, 20.67, 18.68, 11.32. LRMS: (EI) 166 (highest mass), 124 (base peak). HRMS: calculated for $\text{C}_{11}\text{H}_{18}\text{O}$ 166.1358, found 166.1355. $[\alpha]_{\text{D}}$ (c 1.40, CHCl_3) = $+10^\circ$.

Procedure for nucleophilic addition to γ -hydroxy dienyl sulfones:

(1S, 5S, 6S)-5-Benzenesulfonyl-6-methylcyclohex-3-enol (22aMe). To a solution of epoxy-dienyl sulfone **SS-9a** (0.377 g, 1.6 mmol) in THF (10 mL) at -78°C was slowly added LiHMDS (1.8 mL, 1.8 mmol). The solution was stirred for 30 min, followed by addition of sat'd solution of NH_4Cl (5 mL). Et_2O (5 mL) was added to the mixture and separated. The aqueous layer was extracted with Et_2O (2 X 5 mL) and the organic layers are combined, dried over MgSO_4 and concentrated. The resulting solid was dissolved in THF (10 mL) at -78°C was added MeLi (3.4 mL, 4.8 mmol) in Et_2O over a period of 15 min, addition must be done slowly to minimize aromatization. The orange solution was stirred for 20 min and then quenched by slowly adding a solution of sat'd NH_4Cl (5 mL). The temperature was allowed to rise to 25°C and diethyl ether was added (10 mL). The organic layer was separated and the aqueous layer was extracted with diethyl ether (2 X 10 mL). The organic layers were combined, dried over MgSO_4 , and concentrated. The resultant mixture was filtered through a one inch silica gel plug eluting with a 3:1 mixture of ethyl acetate/hexanes to give 0.370 g of the desired sulfone as an oil in 92 % yield and a 9:1 ratio of diastereomers. ^1H NMR (CDCl_3): δ 7.88 (m, 2H), 7.61 (m, 3H), 5.97 (m, 1H), 5.54 (m, 1H), 4.17 (m, 1H), 3.62 (m, 1H), 2.47 (m, 1H), 2.28 (m, 1H), 2.05 (m, 1H), 1.77 (m, 1H), 1.07 (d, $J = 6.9$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 137.9, 133.7, 132.3, 129.1, 128.9, 117.5, 68.6, 66.2, 32.7, 30.3, 15.5. LRMS: (CI) highest mass 253 (M+H), base peak 143. HRMS: (CI) calculated for $\text{C}_{13}\text{H}_{16}\text{O}_3\text{S}$ 253.0898, found 253.0905

(1S, 5S, 6S)-5-Benzenesulfonyl-6-isopropylcyclohex-3-enol (22aPr). To a solution of epoxy-dienyl sulfone **SS-9a** (0.350 g, 1.5 mmol) in THF (10 mL) at -78°C was slowly added LiHMDS (1.6 mL, 1.6 mmol). The solution was stirred for 30 min, followed by addition of a

sat'd solution of NH_4Cl (5 mL). Et_2O (5 mL) was added to the mixture and separated. The aqueous layer was extracted with Et_2O (2 X 5 mL) and the organic layers are combined, dried over MgSO_4 and concentrated. To the resulting solid in THF (10 mL) at -78°C was slowly added $i\text{PrMgCl}$ (3.7 mL, 7.4 mmol) over a period of 15 min, addition must be done slowly to minimize aromatization. The orange solution was stirred for 20 min and the temperature allowed to slowly rise to -10°C over a period of 1h. The solution was quenched by slowly adding a solution of sat'd NH_4Cl (10 mL). The temperature was allowed to rise to 25°C and diethyl ether was added (10 mL). The organic layer was separated and the aqueous layer was extracted with diethyl ether (2 X 10 mL). The organic layers were combined, dried over MgSO_4 , and concentrated. The resultant mixture was filtered through a one inch silica gel plug eluting with a 3:1 mixture of ethyl acetate: hexanes to give 0.375 g of the desired sulfone as an oil in 89 % yield and a 30:1 ratio of diastereomers. ^1H NMR (CDCl_3): δ 7.88 (m, 2H), 7.59 (m, 3H), 5.99 (m, 1H), 5.66 (m, 1H), 4.31 (m, 1H), 3.77 (m, 1H), 2.17 (m, 4H), 0.81 (d, $J = 6.9$ Hz, 3H), 0.76 (d, $J = 6.9$ Hz, 3H). ^{13}C NMR (CDCl_3): δ 137.6, 133.7, 133.2, 129.1, 129.0, 118.5, 65.6, 63.9, 42.6, 31.5, 24.8, 22.1, 19.7. LRMS: (CI) highest mass 281 (M+H), base peak 143. HRMS: (CI) calculated for $\text{C}_{15}\text{H}_{20}\text{O}_3\text{S}$ 281.1211, found 281.1199.

(2*R*, 3*S*, 4*S*)-(3-Benzenesulfonyl-2-methylcyclohept-4-enyloxy)-*tert*-butyldimethylsilane (30). To a solution of dienyl sulfone **2** (Figure 1) (0.322 g, 0.89 mmol) in THF (9 mL) at -78°C was slowly added MeLi (1.8 mL, 1.95 mmol) in Et_2O over a period of 10 min. The orange solution was stirred for 20 min and was then quenched by slowly adding a solution of sat'd NH_4Cl (10 mL). The temperature was allowed to rise to 25°C and diethyl ether was added (10 mL). The organic layer was separated and the aqueous layer was extracted with diethyl ether (2 X 10 mL). The organic layers were combined, dried over MgSO_4 , and concentrated. The resultant mixture was filtered through a one inch silica gel plug eluting with a 3:1 mixture of ethyl acetate: hexanes to give 0.317 g of the desired sulfone as an oil in 94 % yield and a 20:1 ratio of diastereomers. ^1H NMR (CDCl_3): δ 7.87 (m, 2H), 7.58 (m, 3H), 6.03 (m, 1H), 5.87 (m, 1H), 4.60 (m, 1H), 3.83 (m, 1H), 2.42 (m, 4H), 1.77 (m, 1H), 1.63 (m, 1H), 1.41 (m, 1H), 1.09 (d, $J = 7.0$ Hz, 3H), 0.85 (s, 9H), -0.02 (s, 3H), -0.08 (s, 3H). ^{13}C NMR (CDCl_3): δ 139.0, 134.9, 133.4, 129.1, 128.5, 123.2, 73.6, 62.3, 35.9, 27.1, 25.7, 20.0, 17.9, 12.3, -5.1. LRMS: (CI)

highest mass 381 (M+H), base peak 249. HRMS: (CI) calculated for $C_{20}H_{32}O_3SSi$ 381.1920, found 381.1917.

General procedure for molybdenum catalyzed epoxidations:

To a solution of hydroxy allyl sulfone (0.98 mmol) in benzene (10 mL) was added solid molybdenum hexacarbonyl (0.005 g, 0.021 mmol, 5 mol %). The solution was heated to reflux and *tert*-butyl hydrogen peroxide (0.312 mL, 1.56 mmol) in decanes was slowly added over a period of 5 min. The solution was heated at reflux for 1.5 h. The reaction was allowed to cool to 25°C and diethyl ether (10 mL) was added to the reaction mixture. The mixture was washed with a saturated solution of sodium bisulfite (5 mL), and the organic layer was concentrated. The resultant mixture was filtered through a one inch silica gel plug eluting with a 1:1 mixture of ethyl acetate / hexanes; which upon concentration affords epoxy sulfone as a crystalline solid in a high yields and the same ratio as that of the corresponding starting material. The crystalline product can be further recrystallized from chloroform and hexanes to separate the diastereomers.

(1*R*, 3*S*, 4*S*, 5*R*, 6*R*)-5-Benzenesulfonyl-4-methyl-7-oxabicyclo[4.1.0]heptan-3-ol (23aMe). 99% yield 6 : 1 ratio, after recrystalization 83% yield 30:1 ratio. 1H NMR ($CDCl_3$): δ 7.96 (m, 2H), 7.67 (m, 3H), 3.64 (m, 1H), 3.58 (d, J = 3.8 Hz, 1H), 3.51 (d, J = 9.3 Hz, 1H), 3.40 (m, 1H), 2.68 (d, J = 10.8 Hz, 1H, (OH)), 2.40 (ddd, J = 15.7 Hz, 5.6 Hz, 2.7 Hz, 1H), 2.03 (m, 1H), 1.90 (dddd, 15.7 Hz, 5.0 Hz, 3.8 Hz, 1.2 Hz, 1H), 1.25 (d, J = 6.9 Hz, 3H). ^{13}C NMR ($CDCl_3$): δ 137.9, 134.3, 129.6, 128.7, 69.2, 64.0, 53.4, 51.2, 32.4, 29.8, 18.8. LRMS: (CI) highest mass 269 (M+H), base peak 233. HRMS: (CI) calculated for $C_{13}H_{16}O_4S$ 269.0848, found 269.0852. m.p.=133.5°C – 134.0°C. $[\alpha]_D$ (c 2.90, $CHCl_3$) = +27°.

(1*R*, 3*S*, 4*S*, 5*R*, 6*R*)-5-Benzenesulfonyl-4-isopropyl-7-oxabicyclo[4.1.0]heptan-3-ol (23aPr a). 95% >50:1 ratio. 1H NMR ($CDCl_3$): δ 7.94 (m, 2H), 7.67 (m, 3H), 4.05 (m, 1H), 3.89 (d, J = 8.4 Hz, 1H), 3.61 (d, J = 3.7 Hz, 1H), 3.38 (m, 1H), 2.28 (m, 2H), 1.88 (m, 1H), 1.74 (m, 1H), 1.06 (d, J = 7.5 Hz, 3H), 1.03 (d, J = 7.5 Hz, 3H). ^{13}C NMR ($CDCl_3$): δ 138.0, 134.2, 129.5, 128.7, 64.8, 60.7, 53.4, 51.7, 30.2, 29.5, 20.6, 18.3. LRMS: (CI) highest mass 269 (M+H), base

peak 233. HRMS: (CI) calculated for $C_{15}H_{20}O_4S$ 297.1161, found 297.1173. m.p.= 147.5°C - 148.0°C. > 99 % ee HPLC Chiralcel OD 1.0 mL/min 90:10 Hex:2-propanol. 16.04 min. minor enantiomer, 14.60 min. major enantiomer. $[\alpha]_D$ (c 3.1, $CHCl_3$) = +63°.

(1R, 2R, 3R, 4S, 7R)-(2-Benzenesulfonyl-3-methyl-8-oxabicyclo[5.1.0]oct-4-yloxy)-tert-butyltrimethylsilane (31). To a stirring solution of allyl sulfone **30** (0.884 g, 2.33 mmol) in CH_2Cl_2 (23 mL) at room temperature was added *m*-CPBA (1.56 g, 6.33 mmol). The mixture was stirred for 18h at which point diethyl ether (20 mL) was added followed by saturated solution of sodium bisulfite (20 mL). The organic phase was separated and washed with 10% NaOH (2 X 20 mL) then dried over $MgSO_4$ and concentrated to give 0.848 g of the desired epoxy sulfone as a single diastereomer in 92% yield. 1H NMR ($CDCl_3$): δ 7.92 (m, 2H), 7.61 (m, 3H), 3.86 (m, 1H), 3.42 (m, 2H), 3.06 (m, 1H), 2.68 (m, 1H), 1.91 (m, 1H), 1.75 (m, 1H), 1.53 (m, 2H), 1.25 (d, J = 7.5 Hz, 3H), 0.84 (s, 9H), 0.00 (s, 3H), -0.01 (s, 3H). ^{13}C NMR ($CDCl_3$): δ 139.4, 133.7, 129.2, 128.5, 72.2, 63.6, 53.2, 51.6, 37.6, 26.3, 25.6, 22.1, 17.8, 13.0, -5.1, -5.2. LRMS: (EI) highest mass 359 ($M - C_4H_9$), base peak 73. HRMS: (EI) calculated for $C_{20}H_{32}O_4SSi$ 396.1791, found 396.1782.

General procedure for silyl protection of the epoxy alcohols:

To a stirring solution of the epoxy sulfone (0.42 mmol) and triethylamine (0.63 mmol) in CH_2Cl_2 (4.0 mL) at room temperature was added *tert*-butyltrimethylsilyl trifluoromethylsulfonate (0.50 mmol). The solution was stirred for 30 min. Diethyl ether (10 mL) was added and the crude mixture concentrated. The mixture was then filtered through a one inch silica plug eluting with a 1:3 solution of ethyl acetate / hexanes to give, after concentration, the desired protected alcohol in quantitative yield.

(1R, 3S, 4S, 5R, 6R)-(5-Benzenesulfonyl-4-methyl-7-oxa-bicyclo[4.1.0]hept-3-yloxy)-tert-butyltrimethylsilane 23bMe Quantitative yield. 1H NMR ($CDCl_3$): δ 7.91 (m, 2H), 7.62 (m, 3H), 4.15 (ddd, J = 10.4 Hz, 6.3 Hz, 4.4 Hz, 1H), 3.59 (d, J = 2.4 Hz, 1H), 3.35 (d, J = 3.5 Hz, 1H), 3.25 (dd, J = 5.0 Hz, 4.3 Hz, 1H), 2.32 (m, 1H), 1.98 (m, 2H), 1.01 (d, J = 7.2 Hz, 3H), 0.86 (s, 9H), 0.05 (s, 6H). ^{13}C NMR ($CDCl_3$): δ 138.3, 134.0, 129.4, 128.4, 65.7, 65.3, 52.1,

(1*R*, 3*S*, 4*S*, 5*R*, 6*R*)-(5-Benzenesulfonyl-4-isopropyl-7-oxa-bicyclo[4.1.0]hept-3-yloxy)-*tert*-butyldimethylsilane 23b Pr Quantitative yield. 1H NMR ($CDCl_3$): δ 7.93 (m, 2H), 7.64 (m, 3H), 4.41 (ddd, J = 11.1 Hz, 6.9 Hz, 4.3 Hz, 1H), 3.84 (m, 1H), 3.42 (m, 1H), 3.31 (m, 1H), 1.98 (m, 4H), 0.91 (d, J = 6.6 Hz, 3H), 0.88 (s, 9H), 0.66 (d, J = 6.4 Hz, 3H), 0.11 (s, 3H), 0.10 (s, 3H). ^{13}C NMR ($CDCl_3$): δ 138.3, 134.0, 129.4, 128.5, 67.0, 62.6, 52.5, 48.8, 42.6, 29.0, 26.9, 25.8, 23.5, 22.0, 17.9, -4.7, -5.0. LRMS: (CI) highest mass 411 (M+H), base peak 137. HRMS: (CI) calculated for $C_{21}H_{34}O_4SSi$ 411.2025, found 411.2005. $[\alpha]_D$ (c 38.0, $CHCl_3$) = -1°.

General procedure for base induced epoxide opening followed by etherification of β - hydroxy vinyl sulfones:

To a solution of the silylated epoxy sulfone (0.25 mmol) in THF (2.5 mL) was added DBU (0.30 mmol). The stirring solution was heated to reflux for 1h. The temperature was lowered to room temperature and diethyl ether (5 mL) was added to the mixture followed by water (5 mL). The organic phase was separated and concentrated. The resulting mixture was filtered through a one inch silica gel plug eluting with a 1:1 solution of ethyl acetate / hexanes, which upon concentration gives the vinyl sulfone in high yield. Etherification is performed as explained previously.

(1*R*, 4*S*, 5*S*)-3-Benzenesulfonyl-5-(*tert*-butyldimethylsilyloxy)-4-methylcyclohex-2-enol (24Me a). 96 % yield. 1H NMR ($CDCl_3$): δ 7.88 (m, 2H), 7.58 (m, 3H), 6.92 (d, J = 3.2 Hz, 1H), 4.43 (m, 1H), 3.75 (m, 1H), 2.60 (m, 1H), 1.98 (m, 1H), 1.83 (m, 1H), 1.02 (d, J = 6.9 Hz, 3H), 0.82 (s, 9H), 0.01 (s, 3H), -0.04 (s, 3H). ^{13}C NMR ($CDCl_3$): δ 145.1, 139.9, 138.7, 133.4, 129.2, 128.0, 69.0, 66.0, 35.3, 35.2, 25.7, 18.0, 13.7, -4.8, -5.0. LRMS: (CI) highest mass 383 (M+H), base peak 365. HRMS: (CI) calculated for $C_{19}H_{30}O_4SSi$ (M+H - H_2O) 365.1607, found 365.1595. $[\alpha]_D$ (c 88.0, $CHCl_3$) = -2°.

(2*S*, 3*S*, 5*R*)-(3-Benzenesulfonyl-5-methoxy-2-methylcyclohex-3-enyloxy)-*tert*-butyldimethylsilane (24aMe). Reaction time: 10 min, 98% yield. 1H NMR ($CDCl_3$): δ 7.87

(m, 2H), 7.57 (m, 3H), 6.92 (d, $J = 2.4$ Hz, 1H), 4.03 (m, 1H), 3.65 (m, 1H), 3.40 (s, 3H), 2.59 (m, 1H), 1.97 (m, 1H), 1.70 (m, 1H), 0.95 (d, $J = 6.9$ Hz, 3H), 0.83 (s, 9H), -0.03 (s, 3H), -0.04 (s, 3H). ^{13}C NMR (CDCl_3): δ 146.4, 139.8, 136.0, 133.4, 129.2, 128.1, 68.4, 56.3, 35.0, 31.6, 25.6, 18.0, 13.1, -4.9. LRS: (CI) highest mass 397 ($\text{M}+\text{H}$), base peak 263. HRMS: (CI) calculated for $\text{C}_{20}\text{H}_{32}\text{O}_4\text{SSi}$ 396.1791, found 396.1787. $[\alpha]_{\text{D}}$ (c 27.0, CHCl_3) = -0.5° .

(1R, 4S, 5S)-3-Benzenesulfonyl-5-(tert-butyldimethylsilyloxy)-4-isopropylcyclohex-2-enol (24a Pr). 99 % yield. ^1H NMR (CDCl_3): δ 7.85 (m, 2H), 7.58 (m, 3H), 6.88 (d, $J = 3.4$ Hz, 1H), 4.45 (m, 1H), 3.40 (dt, $J = 12.7$ Hz, 4.0 Hz, 1H), 2.27 (m, 1H), 2.01 (m, 2H), 1.74 (m, 1H), 1.14 (d, $J = 7.0$ Hz, 3H), 0.97 (d, $J = 7.3$ Hz, 3H), 0.80 (s, 9H), -0.13 (s, 3H), -0.16 (s, 3H). ^{13}C NMR (CDCl_3): δ 144.1, 139.1, 133.4, 129.2, 128.4, 70.4, 66.2, 46.0, 35.8, 25.7, 25.2, 24.4, 21.8, 18.0, -5.1, -5.2. LRMS: (CI) highest mass 411 ($\text{M}+\text{H}$), base peak 137. HRMS: (CI) calculated for $\text{C}_{21}\text{H}_{34}\text{O}_4\text{SSi}$ 411.2025, found 411.2012. m.p. = $133.5^\circ\text{C} - 134.5^\circ\text{C}$. $[\alpha]_{\text{D}}$ (c 5.0, CHCl_3) = -60° .

(1S, 2S, 5R)-(3-Benzenesulfonyl-2-isopropyl-5-methoxycyclohex-3-enyloxy)-tert-butyldimethylsilane (24b Pr). Reaction time: 10 min 98% yield. m.p. = $133.5-134.5^\circ\text{C}$. ^1H NMR (CDCl_3): δ 7.85 (m, 2H), 7.57 (m, 3H), 6.97 (d, $J = 3.5$ Hz, 1H), 4.01 (m, 1H), 3.41 (s, 3H), 3.38 (m, 1H), 2.24 (m, 2H), 1.97 (m, 1H), 1.74 (m, 1H), 1.13 (d, $J = 6.9$ Hz, 3H), 0.94 (d, $J = 6.9$ Hz, 3H), 0.80 (s, 9H), -0.13 (s, 3H), -0.16 (s, 3H). ^{13}C NMR (CDCl_3): δ 144.7, 139.2, 136.6, 133.3, 129.1, 128.4, 74.6, 70.5, 56.6, 49.1, 32.8, 25.7, 25.3, 24.5, 21.6, 18.0, -5.1, -5.2. (1R, 4R, 5S)-3-Benzenesulfonyl-5-(tert-butyldimethylsilyloxy)-4-methylcyclohept-2-enol Reaction time 5h, 97 % yield. ^1H NMR (CDCl_3): δ 7.87 (m, 2H), 7.55 (m, 3H), 7.19 (d, $J = 3.5$ Hz, 1H), 4.51 (m, 1H), 3.80 (ddd, $J = 7.2$ Hz, 4.6 Hz, 2.3 Hz, 1H), 2.86 (dq, $J = 7.3$ Hz, 2.1 Hz, 1H), 2.65 (d, $J = 6.6$ Hz, 1H, (OH)), 2.14 (m, 1H), 1.92 (m, 1H), 1.80 (m, 1H), 1.69 (m, 1H), 0.97 (d, $J = 7.3$ Hz, 3H), 0.75 (s, 9H), -0.07 (s, 3H), -0.19 (s, 3H). ^{13}C NMR (CDCl_3): δ 145.5, 142.5, 139.5, 133.1, 129.1, 128.5, 71.0, 70.0, 40.0, 28.6, 28.0, 25.8, 18.0, 16.3, -5.0, -5.5.

LRMS: (EI) highest mass 339 ($M - C_4H_9$), base peak 75. (CI) highest mass 397 ($M+H$), base peak 379. HRMS: (EI) calculated for $C_{20}H_{32}O_4SSi$ 396.1791, found 396.1772.

(1S, 2R, 5R)-(3-Benzenesulfonyl-5-methoxy-2-methylcyclohept-3-enyloxy)-tert-butyldimethylsilane Reaction time 10 min, 98% yield. . White solid m.p. = 116.0°C - 117.5°C. 1H NMR ($CDCl_3$): δ 7.84 (m, 2H), 7.52 (m, 3H), 7.19 (m, 1H), 3.95 (dt, $J = 11.4$ Hz, 2.9 Hz, 1H), 3.74 (m, 1H), 3.38 (s, 3H), 2.82 (dq, $J = 12.1$ Hz, 7.3 Hz, 1H), 1.78(m, 4H) 0.93 (d, $J = 7.5$ Hz, 3H), 0.72 (s, 9H), -0.10 (s, 3H), -0.21 (s, 3H). ^{13}C NMR ($CDCl_3$): δ 145.5, 142.5, 139.5, 133.1, 129.1, 128.5, 71.0, 70.0, 40.0, 28.6, 28.0, 25.8, 18.0, 16.3, -5.0, -5.5. LRMS: (CI) highest mass 411 ($M+H$), base peak 411. HRMS: (CI) calculated for $C_{21}H_{34}O_4SSi$ 411.2025, found 411.2030.

Enone formation:

(4R, 5S)-5-(tert-Butyldimethylsilyloxy)-3,4-dimethylcyclohex-2-enone (25aMe).

t-BuLi (0.32 mL, 0.38 mmol) was slowly added to a mixture of HMPA (0.17 mL, 0.95 mmol) and β -methoxy vinyl sulfone **24aMe** (0.08g, 0.19 mmol) in 2 mL THF at -78°C. The resulting bright orange mixture was stirred at -78°C for 5 min. Iodomethane (0.06 mL, 0.95 mmol) was added and was stirred for 15 min. 1 mL of sat'd solution of $NaHCO_3$ was added and the reaction allowed to warm to room temperature. The mixture was extracted into diethyl ether (4 mL) and concentrated *in vacuo*. $CHCl_3$ (1mL) was added followed by SiO_2 (0.500 g) and the reaction was stirred for 2 h. Monitoring the reaction was best accomplished by 1HNMR . When complete, the silica was filtered and the solution was concentrated. Silica gel column purification eluting with 1:4 ethyl acetate / hexanes provided the desired enone in 0.044 g, 93 % yield. 1H NMR ($CDCl_3$): δ 5.83 (s, 1H), 4.17 (dt $J = 10.7$ Hz, 5.2 Hz, 1H), 2.32 (m, 3H), 1.99 (s, 3H), 1.16 (d, $J = 7.2$ Hz 3H), 0.89 (s, 9H), 0.06 (s, 6H). ^{13}C NMR ($CDCl_3$): δ 198.4, 165.5, 126.1, 69.2, 42.2, 41.8, 25.7, 23.1, 18.0, 11.7, -4.7, -4.9. LRMS: (CI) highest mass 255 ($M+H$), base peak 255 . HRMS: (CI) calculated for $C_{14}H_{26}O_2Si$ 255.1780, found 255.1779. 98.7% ee HPLC Chiralcel OD 1.0 mL/min 90.0:10.0 Hex:2-propanol. 5.25 min. minor enantiomer, 4.46 min. major enantiomer. $[\alpha]_D$ (c 9.9, $CHCl_3$) = -41°.

(4R, 5S)-5-(tert-Butyldimethylsilanyloxy)-4-isopropyl-3-methylcyclohex-2-enone (25aPr).

t-BuLi (0.15 mL, 0.18 mmol) was slowly added to a mixture of HMPA (0.08 mL, 0.45 mmol) and β -methoxy vinyl sulfone **24aPr** (0.0382 g, 0.09 mmol) in 2 mL THF at -78°C. The resulting bright orange mixture was stirred at -78°C for 5 min. Iodomethane (0.03 mL, 0.45 mmol) was added and was stirred for 15 min. Sat. NaHCO₃ (2 mL) was added and the reaction allowed to warm to room temperature. The mixture was extracted into diethyl ether (5 mL) and concentrated *in vacuo*. CHCl₃ (1 mL) was added followed by SiO₂ (0.500 g) and the reaction was stirred for 3 h. Monitoring the reaction was best accomplished by ¹H NMR. When complete, the silica was filtered and the solution was concentrated. Silica gel column purification eluting with 1:4 ethyl acetate / hexanes provided the desired enone in 0.023 g, 91% yield. ¹H NMR (CDCl₃): δ 5.92 (s, 1H), 4.21 (dt, *J* = 11.4 Hz, 5.8 Hz, 1H), 2.46 (m, 3H), 2.25 (m, 1H), 2.01 (d, *J* = 1.4 Hz, 1H), 1.14 (d, *J* = 7.0 Hz, 3H), 0.90 (s, 9H), 0.88 (d, *J* = 7.2 Hz, 3H), 0.070 (s, 3H), 0.065 (s, 3H). ¹³C NMR (CDCl₃): δ 199.0, 163.9, 127.8, 69.9, 53.1, 42.9, 26.0, 25.7, 25.4, 24.5, 21.0, -4.7, -4.8. LRMS: (CI) highest mass 283 (M+H⁺), base peak 283. HRMS: (CI) calculated for C₁₆H₃₀O₂Si 283.2093, found 283.2094. 97.7% ee HPLC Chiralcel OD 1.0 mL/min 90.0:10.0 Hex:2-propanol. 4.67 min. minor enantiomer, 4.13 min. major enantiomer. [α]_D (c 4.0, CHCl₃) = -68°.

(4S, 5S)-5-(tert-Butyldimethylsilanyloxy)-3,4-dimethylcyclohept-2-enone.

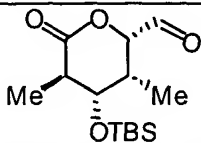

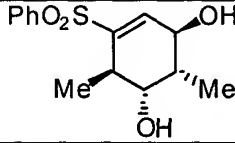

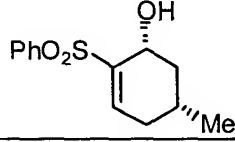

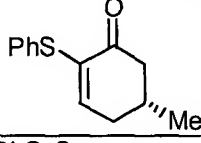

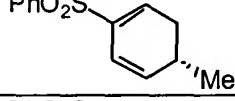

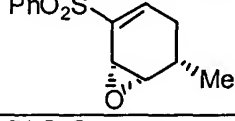

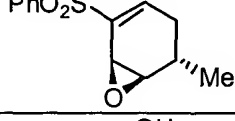

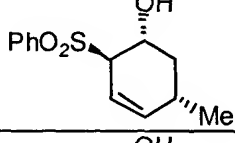

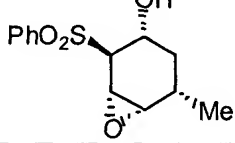

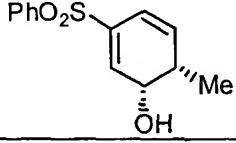

t-BuLi (0.06 mL, 0.07 mmol) was added to the β -methoxy vinyl sulfone **33** (0.02 g, 0.05 mmol) in 1 mL THF at -78°C over 2 min. The resulting bright orange solution was stirred at -78°C for 5 min. Iodomethane (0.02 mL, 0.25 mmol) was added and was stirred for 15 min. Sat. NaHCO₃ (1 mL) was added and the reaction allowed to warm to room temperature. The mixture was extracted into diethyl ether (5 mL) and concentrated *in vacuo*. CHCl₃ (1 mL) was added followed by SiO₂ (0.500 g) and the reaction was stirred for 4 h. Monitoring the reaction was best accomplished by NMR. When complete, the silica was filtered and the solution was concentrated. Silica gel chromatography eluting with 1:4 ethyl acetate / hexanes provided the desired enone in 0.011 g, 84 % yield. ¹H NMR (CDCl₃): δ 5.85 (s, 1H), 3.87 (ddd, *J* = 8.1 Hz, 5.6 Hz, 2.4 Hz, 1H), 2.84 (dq, *J* = 16.3 Hz, 10.8 Hz, 1H), 2.49 (m, 2H), 2.04 (m, 1H), 1.92 (d, *J* = 1.2 Hz, 3H), 1.82 (m, 1H), 1.14 (d, *J* = 7.3 Hz, 3H), 0.88 (s, 9H), 0.06 (s, 6H). ¹³C NMR (CDCl₃): δ 204.2, 155.4, 128.5, 72.7, 47.6, 37.8, 27.5, 26.4, 18.1, 18.0, -4.7, -4.9. LRMS: (EI)

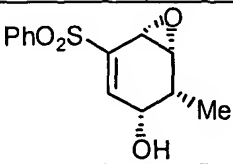

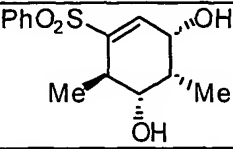

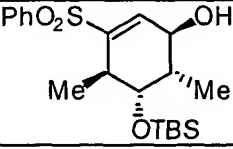

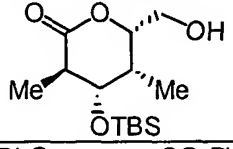

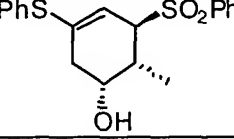

highest mass 211 (M+H - C₄H₉), base peak 75. HRMS: (EI) calculated for C₁₅H₂₈O₂Si 268.1859, found 268.1848. 99.2% ee HPLC Chiralcel AD 1.0 mL/min 99.0:1.0 Hex:2-propanol. 11.18 min. minor enantiomer, 9.27 min. major enantiomer. [α]_D (c 0.4, CHCl₃) = +50°.

(4S, 5S)-5-(*tert*-Butyldimethylsilanyloxy)-2,4-dimethylcyclohept-2-enone. To a solution of a methyl substituted hydroxy dienyl sulfone (0.132 g, 0.33 mmol) in THF (3.3 mL) at -78°C was slowly added MeLi (0.83 mL, 0.99 mmol) in Et₂O over a period of 10 min. The temperature was allowed to slowly rise to -10°C and was then quenched by slow addition of a solution of sat'd NH₄Cl (5 mL). The temperature was allowed to rise to 25°C and diethyl ether was added (10 mL). The organic layer was separated and the aqueous layer was extracted with diethyl ether (2 X 10 mL). The organic layers were combined, dried over MgSO₄, and concentrated. CH₂Cl₂ (6 mL) was added to the mixture followed by PCC (0.310 g, 1.44 mmol). The mixture was allowed to stir for 2 h. THF (5 mL) was added followed by 10% NaOH (2 mL), and the mixture was allowed to stir for 10 h. At this point H₂O (5 mL) was added followed by diethyl ether (10 mL) and the mixture separated, the aqueous layer was extracted with diethyl ether (2 X 10 mL). The combined organic layer were dried over MgSO₄ and concentrated. Purification was done by silica gel chromatography eluting with a 1:9 solution of ethyl acetate / hexanes to give 0.84 g of the desired enone as an oil in 88 % yield. ¹H NMR (CDCl₃): δ 6.06 (m, 1H), 3.65 (dt, J = 8.2 Hz, 3.8 Hz, 1H), 2.75 (m, 1H), 2.59 (m, 1H), 2.48 (m, 1H), 1.95 (m, 1H), 1.80 (s, 3H), 1.79 (m, 1H), 1.17 (d, J = 6.9 Hz, 3H), 0.89 (s, 9H), 0.06 (s, 6H). ¹³C NMR (CDCl₃): δ 205.4, 144.1, 137.3, 73.8, 40.2, 37.9, 30.8, 25.8, 19.3, 18.0, -4.3, -4.8. LRMS: (EI) highest mass 268 (M+H), base peak 73. (CI) highest mass 269 (M+H), base peak 269. HRMS: (CI) calculated for C₁₅H₂₈O₂Si 269.1937, found 269.1930. 99.7% ee HPLC Chiralcel AD 1.0 mL/min 99.0:1.0 Hex:2-propanol. 3.70 min. minor enantiomer, 4.08 min. major enantiomer. [α]_D (c 11.0, CHCl₃) = +139°.

General Synthetic Procedures

All common reagents and solvents were purchased from commercial suppliers and used as received. Solvents were dried by standard methods: tetrahydrofuran (THF) and diethyl ether were distilled from sodium benzophenone ketyl. Benzene, toluene, dichloromethane (CH_2Cl_2), and acetonitrile (CH_3CN) were distilled from calcium hydride. Powdered 4Å molecular sieves (Aldrich) were oven and/or flame activated under vacuum prior to use.

All glassware was oven dried and/or flame dried, evacuated, and purged with nitrogen. All reactions involving air and moisture-sensitive compounds were carried out under a nitrogen atmosphere, and the reaction flasks were fitted with rubber septa for the introduction of substrates and reagents via syringe. The progress of reactions was monitored by thin layer chromatography (TLC) in comparison with the starting material(s). TLC was performed on glass-backed silica gel 60 F 254 plates (EM reagents, 0.25 mm) and eluted with a mixture of ethyl acetate (EA) and hexanes (Hex) or the specified solvent solutions. Analytically pure samples were obtained from flash silica gel chromatography (SGC), using silica gel 60, 230-400 mesh, or from recrystallization of the crude products. Melting points were obtained on a MEL-TEMP capillary melting point apparatus and uncorrected. ^1H -NMR spectra were recorded on Varian IONVA-300 (300 MHz) and Varian VXR (500 MHz) spectrometers. ^{13}C -NMR spectra were recorded on Varian INOVA-300 (75 MHz) and Varian VXR (125 MHz) spectrometers. NMR spectra were determined in chloroform- d_1 (CDCl_3) solution and are reported in parts per million (ppm) from the residual chloroform (7.26 ppm and 77.00 ppm). Peak multiplicities in ^1H -NMR spectra, when reported, are abbreviated as s (singlet), d (doublet), t (triplet), m (multiplet), and br (broad). Mass spectra were run by the Purdue University campus wide

mass spectrometry facility. Low resolution EI and CI (isobutane) spectra were obtained on a Finnigan 4000 mass spectrometer with a Nova 4 data system with the molecular ion designated as " M^+ ". High resolution mass spectra were obtained on a Kratos MS-50 instrument.

Experimental Section

22 z

(2S, 3S, 4S, 5R)-4-(tert-Butyl-dimethyl-silanyloxy)-3,5-dimethyl-6-oxo-tetrahydro-pyran-2-carbaldehyde (**22z**). To a cold ($-30\text{ }^{\circ}\text{C}$) mixture of **38** (165 mg, 0.416 mmol) and NaHCO_3 (35 mg, 0.42 mmol) in methylene chloride was bubbled O_3 for 1 h, then switched to O_2 for 5 min to expell excess ozone, followed by addition of methyl sulfide (0.5 mL). The resulting mixture was warmed to room temperature, and stirred for 5 h. The solvent was removed via rotary evaporation, dissolved in diethyl ether (20 mL), washed with H_2O , brine, and dried over Na_2SO_4 . The ether was removed via rotary evaporation, and further dried in vacuo to afford 140 mg crude oily residue. Fairly pure aldehyde **22** (90% purity by ^1H NMR) can be obtained with florisil column chromatography (ethyl acetate/hexanes; 1:3), but in a poor yield due to decomposition during column chromatography. ^1H NMR (CDCl_3 , 300 MHz): s, 1H), δ 9.68 (s, 1H), 4.58 (dd, $J = 1.5, 4.5$ Hz, 1H), 3.76 (dd, $J = 2.4, 4.5$ Hz, 1H), 2.74 (m, 1H), 2.61 (m, 1H), 1.38 (d, $J = 7.5$ Hz, 3H), 1.13 (d, $J = 6.9$ Hz, 3H), 0.92 (s, 9H), 0.13 (s, 3H), 0.11 (s, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 198.4, 172.0, 83.3, 73.8, 43.2, 34.9, 25.6, 17.9, 16.2, 10.2, -4.7, -4.8.

23 z

(1S, 2R, 3S, 4R)-5-Benzenesulfonyl-2,6-dimethyl-cyclohex-4-ene-1,3-diol (**23z**). To a mixture of **37z** (1.06 g, 3.75 mmol), PPh_3 (2.95 g, 11.2 mmol), and HCO_2H (0.90 mL, 5.62 mmol) in THF (37 mL) was added diethyl azodicarboxylate (1.87 mL, 11.2 mmol) dropwise via syringe at room temperature. After being stirred at room temperature for 2 h, the solution was concentrated via rotary evaporation. The residue was dissolved in methanol (40 mL), and excess NaHCO_3 was added. After being stirred at room temperature for 30 min, the solvent was removed via rotary evaporation, the residue was

loaded onto silica gel, and eluted with ethyl acetate and hexanes mixture (1:1) to afford 1.0 g (95%) of 23 as a light yellow oil. ^1H NMR (CDCl_3 , 300 MHz): δ 7.88 (d, J = 7.2 Hz, 2H), 7.51-7.65 (m, 3H), 6.93 (d, J = 2.4 Hz, 1H), 4.21 (d, J = 9 Hz, 1H), 3.66 (s, 1H), 2.49 (q, J = 6.6 Hz, 1H), 1.94 (br s, 1H), 1.82 (m, 1H), 1.60 (br s, 1H), 1.18 (d, J = 6.9 Hz, 3H), 1.15 (d, J = 7.2 Hz, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 143.0, 139.7, 139.3, 133.5, 129.2, 128.0, 77.2, 70.4, 37.6, 35.7, 18.04, 14.6. MS(CI) m/z 283 $[\text{M} + \text{H}]^+$; HRMS (EI) calcd for $\text{C}_{14}\text{H}_{19}\text{O}_4\text{S}$, 283.1004; found, 283.0998.

(1R, 5R)-2-Benzenesulfonyl-5-methyl-cyclohex-2-enol (24z). A solution of ketone 28z (45 g, 206 mmol) and $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$ (106 g, 284 mmol) in MeOH (500 ml) was cooled to 0°C . Under mechanical stirring, 10.6 g (279 mmol) of NaBH_4 was added in

small portions. When the reaction was complete by TLC, H_2O was slowly added until no further bubbling was observed, then a total of 500 ml of H_2O was added. The solution was then extracted with CH_2Cl_2 (3×300 mL). If the solution forms an emulsion, 10-20 mL of aqueous 5% HCl can be added which will clear the solution and break any emulsion. The combined organic layers were dried over Na_2SO_4 , and concentrated via rotary evaporation to afford 43 g analytically pure compound, which was used directly for next oxidation step. It was dissolved in MeOH (800 mL) and THF (200 mL), and cooled to 0°C , under mechanical stirring, a solution of 380 g (600 mmol) of Oxone in H_2O (800 mL) was added in portions. The cooling bath was removed after half of the Oxone solution was added, and the reaction was stirred for further 24 h at room temperature, then 300 mL of CH_2Cl_2 was added, the layers were separated, and the aqueous layer was further extracted with CH_2Cl_2 (4×300 mL). The combined organic layers were dried over Na_2SO_4 , and concentrated via rotary evaporation to give 46.9 g (95%) of an analytically pure white solid. Mp $79.0 - 81.0^\circ\text{C}$; ^1H NMR (CDCl_3 , 300 MHz): δ 7.91-7.95 (m, 2H), 7.53-7.68 (m, 3H), 7.14 (dd, J = 5.7, 2.7 Hz, 1H), 4.54 (m, 1H), 3.38 (br s, 1H), 2.38 (dm, J = 18.9 Hz, 1H), 2.11 (m, 1H), 1.94 (ddt, J = 18.9, 9.8, 2.7 Hz, 1H), 1.76 (m, 1H), 1.41 (td, J = 12.4, 8.9 Hz, 1H), 1.00 (d, J = 6.6 Hz, 3H). ^{13}C NMR (CDCl_3 , 75 MHz): δ 142.9, 142.3, 140.9, 133.6, 129.4, 127.9, 65.6, 40.1, 34.6, 27.5, 21.3. Anal. Calcd for $\text{C}_{13}\text{H}_{16}\text{O}_3\text{S}$: C, 61.88; H, 6.39. Found: C, 61.73; H, 6.25.

(5R)-5-Methyl-2-phenylsulfanyl-cyclohex-2-enone (28z). To a solution of sulfoxide 27z (56.0 g, 0.237 mol) and Ac₂O (27.0 mL, 0.284 mol) in CH₂Cl₂ (800 mL) was added 0.5 mL (7.7 mmol) of methanesulfonic acid. After being stirred at room temperature for 14 h, saturated aqueous NaHCO₃ was added in small portions until no more CO₂ was generated. The organic layer was separated, and the aqueous layer extracted with CH₂Cl₂ (2 × 100 mL). The combined organic layers were washed with brine and dried over Na₂SO₄. The solvent was removed via rotary evaporation to give 48.6g (94%) of analytically pure 28 as a light yellow oil. Compound 28 was used for next step without further purification. If necessary, it can be purified with flash column chromatography (ethyl acetate/hexanes; 1:10). ¹H NMR (CDCl₃, 300 MHz) δ 7.30-7.42 (m, 5H), 6.46 (dd, J = 3.0, 6.0 Hz, 1H), 2.56-2.67 (m, 1H), 2.37-2.46 (m, 1H), 2.18-2.28 (m, 2H), 2.00-2.11 (m, 1H), 1.05 (d, J = 6.0 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz) δ 195.0, 144.4, 136.8, 133.4, 131.8, 129.2, 127.9, 46.3, 35.0, 30.1, 20.6. MS(EI) m/z 218 [M]⁺; HRMS (EI) calcd for C₁₃H₁₄OS, 218.0765; found, 218.0765.

(4S)-4-Methyl-cyclohexa-1,5-dienesulfonyl-benzene (29z). To a solution of 24z (355 mg, 1.40 mmol) and Et₃N (0.19 mL, 1.40 mmol) in THF (10 mL) at 0°C was added 0.11 mL (1.40 mmol) of MsCl dropwise. After stirring at 0°C for 1 h, the reaction mixture was cooled to -78°C, and freshly prepared LiHMDS (2.8 mL, 1.0 M in THF, 2.8 mmol) was added dropwise over 20 min. After stirring at -78 °C for 15 min, the reaction was quenched with saturated aqueous NH₄Cl, diluted with ether, separated, further extracted with ether. The organic layers were washed with brine, dried over Na₂SO₄, and concentrated via rotary evaporation. The crude residue was purified with flash column chromatography (ethyl acetate/hexanes; 1:3) to provide 303 mg (92% yield) of 29 as a white solid with 99% ee by HPLC (Chiralpak AD 1.0 ml/min; 95:5 Hex:2-propanol, 19.57 min for minor enantiomer, 20.51 min for major enantiomer). Mp 54.0-56.0 °C; ¹H NMR (CDCl₃, 300 MHz): δ 7.85 (m, 2H), 7.48-7.61 (m, 3H), 6.91 (t, J = 4.2 Hz, 1H), 6.01 (d, J = 10.3 Hz, 1H), 5.81 (dd, J = 10.3, 3.9 Hz, 1H), 2.38-2.57 (m, 2H), 2.15 (ddd, J = 17.1, 11.1, 4.5 Hz,

1H), 0.98 (d, $J = 6.6$ Hz, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 139.9, 138.2, 136.4, 134.5, 133.2, 129.1, 127.6, 117.4, 30.6, 26.9, 19.4. MS(EI) m/z 233 $[\text{M}-\text{H}]^+$; HRMS (EI) calcd for $\text{C}_{13}\text{H}_{13}\text{O}_2\text{S}$, 233.0636; found, 233.0632.

(3S, 4S, 5S)-2-Benzenesulfonyl-5-methyl-7-oxa-bicyclo[4.1.0]-hept-2-ene (30z). mCPBA oxidation: To a solution of dienyl sulfone 29z (108 mg, 0.461 mmol) in methylene chloride (5 mL) was added 151 mg (70-75% purity) of mCPBA in one portion. After stirring at room temperature for 4 h, aqueous NaHSO_3 solution was added, and the organic layer was separated. The aqueous layer was extracted with methylene chloride (2×5 mL), the combined organic layers were washed with saturated aqueous sodium carbonate, brine, dried over anhydrous sodium sulfate, concentrated via rotary evaporation. The crude residue was purified with flash column chromatography (ethyl acetate/hexanes; 1:4) to give 97 mg (84%) of a mixture of two diastereomers (30:31; 3:2) verified by ^1H NMR.

Jacobsen epoxidation: The mixture of dienyl sulfone 29z (106 mg, 0.453 mmol), (R,R)-(-)-N,N'-Bis(3,5-di-tert-butylsalicylidene)-1,2-cyclohexanediamino-manganese(III) chloride (14 mg, 0.0226 mmol), ammonia acetate (35 mg, 0.453 mmol) in methylene chloride (2.0 mL) and methanol (2.0 mL) was cooled to 0°C , and 0.4 mL of 30% H_2O_2 was added in portions under mechanically stirring (550 rps). After being stirred at 0°C for 5 h, aqueous NaHSO_3 was added, extracted with methylene chloride (3×10 mL). The combined organic layers were washed with brine, dried over Na_2SO_4 , concentrated via rotary evaporation, and purified with flash column chromatography (ethyl acetate/hexanes; 1:2) to afford 62 mg (55%) of a mixture of two diastereomers (30:31; 6:1) verified by ^1H NMR.

From 33z. To a solution of 33z (1.59 g, 5.92 mmol) and Et_3N (2.1 mL, 14.8 mmol) in CH_2Cl_2 (50 mL) at 0°C was slowly added 0.60 mL (7.75 mmol) of MsCl via syringe over 10 min. After stirring at 0°C for further 5 min, the reaction mixture was quenched with saturated aqueous NH_4Cl , and extracted with CH_2Cl_2 (3×30 mL). The organic layers were washed with brine, dried over Na_2SO_4 , and concentrated via rotary evaporation.

The crude residue was purified with flash column chromatography (ethyl acetate/hexanes; 1:4) to afford 1.41 g (95%) of 30 as a white solid. Mp 63.0 – 65.0 °C; ¹H NMR (CDCl₃, 300 MHz): δ 7.90-7.93 (m, 2H), 7.53-7.68 (m, 3H), 7.15 (dt, J = 7.2, 2.4 Hz, 1H), 3.71 (dd, J = 4.2, 2.4 Hz, 1H), 3.39 (ddd, J = 4.2, 2.1, 1.2 Hz, 1H), 2.33 (m, 1H), 1.90 (m, 2H), 1.26 (d, J = 6.6 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz): δ 142.3, 140.1, 138.40 133.8, 129.7, 128.0, 59.5, 47.2, 29.5, 26.5, 18.7. Anal. Calcd for C₁₃H₁₄O₃S: C, 62.38; H, 5.64. Found: C, 62.12; H, 5.68.

(2R, 3R, 4S)-2-Benzenesulfonyl-5-methyl-7-oxa-bicyclo[4.1.0]-hept-2-ene (31z). ¹H NMR (CDCl₃, 300 MHz): δ 7.90-7.92 (m, 2H), 7.53-7.68 (m, 3H), 7.08 (dt, J = 7.2, 2.4 Hz, 1H), 3.64 (dd, J = 4.2, 2.4 Hz, 1H), 3.33 (ddd, J = 4.2, 2.1, 1.8 Hz, 1H), 2.50 (m, 1H), 2.38 (ddd, J = 18.0, 7.8, 2.1 Hz, 1H), 2.13 (dd, J = 18.0, 7.2 Hz, 1H), 0.89 (d, J = 7.2 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz): 140.0, 139.6, 137.5, 133.4, 129.3, 127.5, 58.4, 44.9, 28.2, 24.5, 15.5; MS(EI) m/z 250 [M]⁺; HRMS (EI) calcd for C₁₃H₁₄O₃S, 250.0664; found, 250.0664.

(1R, 2R, 5S)-2-Benzenesulfonyl-5-methyl-cyclohex-3-en-1-ol (32z). To a solution of compound 24z (6.62 g, 26.2 mmol) in CH₂Cl₂ (40 mL) was added 10 drops of DBU, and the resulting mixture was stirred at room temperature for 24 h. The solution was concentrated via rotary evaporation, the crude residue was separated with flash column chromatography (CH₂Cl₂/CH₃CN; 10:1) to provide 4.37 g (66%) of compound 32 as a white solid, and 1.61 g (24%) of starting material 24, which can be re-submitted to isomerization. Mp 72.0 - 74.0 °C; ¹H NMR (CDCl₃, 300 MHz): □ 7.94 (m, 2H), 7.58-7.78 (m, 3H), 5.76 (d, J = 9.9 Hz, 1H), 5.5 (dt, J = 9.9, 2.4 Hz, 1H) 4.09 (m 1H), 3.84 (m, 2H), 2.11 (m, 2H), 1.30 (m, 1H), 1.01 (d, J = 6.9 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz): □ 140.4, 136.2, 134.4, 129.6, 129.3, 116.8, 70.7, 66.6, 38.4, 30.2, 20.9. MS(CI) m/z 253 [M + H]⁺; HRMS (CI) calcd for C₁₃H₁₇O₃S, 253.0898; found, 253.0898.

(1R, 2S, 3S, 4S, 5S)-2-Benzenesulfonyl-5-methyl-7-oxa-bicyclo[4.1.0]-heptan-3-ol (33z). To a solution of 32 (2.29 g, 9.07 mmol) in

CH₂Cl₂ (90 mL) was added mCPBA (13.5 g, 70-75% purity) in portions. After stirring at room temperature for 3 days, the excess mCPBA was quenched with saturated aqueous NaHSO₃, the organic layer was separated, and the aqueous layer was extracted with ethyl acetate (3 × 100 mL). The combined organic layers were washed with saturated aqueous Na₂CO₃ twice, brine, and dried over Na₂SO₄. The solvent was removed via rotary evaporation, and the crude residue was purified with flash column chromatography (ethyl acetate/hexanes; 1:2) to afford 2.09 g (86%) of 33 as a white solid. Mp 81.6 - 83.6 °C; ¹H NMR (CDCl₃, 300 MHz): δ 8.02 (m, 2H), 7.64-7.80 (m, 3H), 4.17 (ddd, J = 12.6, 9.6, 3.9 Hz, 1H), 3.72 (s, 1H), 3.48 (d, J = 9.0 Hz, 1H), 3.26 (d, J = 3.6 Hz, 1H), 3.07 (d, J = 3.3 Hz, 1H), 2.07 (m, 1H), 1.75 (dt, J = 12.6, 4.8 Hz, 1H), 1.35 (m, 1H), 1.15 (d, J = 6.9 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz): δ 137.5, 134.9, 129.5, 129.0, 67.3, 65.8, 57.0, 50.5, 32.4, 28.8, 18.4. Anal. Calcd for C₁₃H₁₆O₄S: C, 58.19; H, 6.01. Found: C, 58.34; H, 5.84.

(1S, 6S)-3-Benzenesulfonyl-6-methylcyclohexa-2, 4-dienol (35z).

Procedure 1: A solution of 30 (2.77 g, 11.1 mmol) in THF (100 mL) was cooled at -78 °C, and a freshly prepared LiHMDS solution (12.0 mL, 1.0 M in THF, 12.0 mmol) was added dropwise. After stirring at -78 °C for 15 min, the saturated aqueous NH₄Cl was added, the resulting solution was extracted with ethyl acetate (3 × 50 mL). The combined organic layers were dried over Na₂SO₄ and concentrated via rotary evaporation. The crude residue was purified with flash column chromatography (ethyl acetate/hexanes; 1:3) to provide 2.68 g (97%) of 35 as a white solid. ¹H NMR (CDCl₃, 300 MHz): δ 7.87 (m, 2H), 7.63 (m, 1H), 7.55 (m, 2H), 6.99 (dd, J = 5.1, 1.2 Hz, 1H), 6.16 (dt, J = 9.6, 1.8 Hz, 1H), 5.89 (dd, J = 9.6, 3.6 Hz, 1H), 4.36 (dd, J = 6.9, 5.1 Hz, 1H), 2.49 (m, 1H), 1.8 (bs, 1H), 1.14 (d, J = 7.5 Hz, 3H); ¹³C NMR (CDCl₃, 75 MHz): δ 139.6, 139.4, 137.1, 134.3, 133.9, 129.6, 128.2, 117.6, 67.2, 34.6, 12.5. Anal. Calcd for C₁₃H₁₄O₃S: C, 62.38; H, 5.64. Found: C, 62.57; H, 5.67.

Procedure 2: Compound 43β (34.9 mg, 0.097 mmol) was dissolved in dry methylene chloride (5 mL), and 81 μL of Et₃N (0.58 mmol) was added at room temperature,

followed by addition of 88 μL (0.485 mmol) of TMSOTf. This mixture was brought to reflux under N_2 , and stirred for 4 h until the starting material was consumed (monitored by TLC). The reaction mixture was cooled to 0 $^\circ\text{C}$, and the excess of TMSOTf was quenched by adding MeOH (1.0 mL, 24.7 mmol), diluted with EtOAc (5 mL), separated, and the aqueous layer was extracted with EtOAc (2×5 mL). The combined organic layers were dried over MgSO_4 and concentrated. The residual mixture was dissolved in methylene chloride (5 mL), and solid m-CPBA (41 mg, $\sim 90\%$ purity, 0.21 mmol) was added in portions. The purity of the m-CPBA is crucial for good yields. The reaction mixture was left stirring for 6 h. 2 mL of saturated solution of NaHSO_3 was added to the mixture, followed by 5 mL of EtOAc. The organic layer was separated, and the aqueous layer was extracted with EtOAc (3×5 mL). The combined organic layers were washed with saturated NaHCO_3 (3×10 mL), followed by brine (5 mL), and dried over Na_2SO_4 . Flash column chromatography (EtOAc-hexane; 1:3) afforded 21.7 mg (89%) of 35.

(1S, 2R, 3R, 4R)-5-Benzenesulfonyl-2-methyl-7-oxa-bicyclo[4.1.0]hept-4-en-3-ol (36z). To a mixture of 35 (330 mg, 1.32 mmol) and $\text{Mo}(\text{CO})_6$ (7 mg, 0.026 mmol) in benzene (13 mL) was added 0.40 mL of tert-butyl hydroperoxide (~ 2 mmol, 5.0-6.0 M in

decane) via syringe, the resulting mixture was brought to reflux under nitrogen. After stirring at reflux for 1.5 h, the reaction mixture was cooled to room temperature, and the solution was loaded to silica gel directly, eluted with CH_2Cl_2 - CH_3CN (10:1) mixture. The organic was removed via rotary evaporation to afford 330 mg (94%) of 36 as a white solid. Mp 73.2 – 75.2 $^\circ\text{C}$; ^1H NMR (CDCl_3 , 300 MHz): δ 7.98 (m, 2H), 7.59-7.74 (m, 3H), 7.38 (dd, $J = 6.6, 2.4$ Hz, 1H), 4.15 (br s, 1H), 3.90 (dd, $J = 4.5, 2.7$ Hz, 1H), 3.57 (dd, $J = 4.5, 2.4$ Hz, 1H), 2.03 (m, 1H), 1.82 (br s, 1H), 1.43 (d, $J = 7.2$ Hz, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 141.6, 141.5, 139.1, 134.3, 129.9, 128.3, 66.3, 60.8, 48.5, 31.9, 13.3; Anal. Calcd for $\text{C}_{13}\text{H}_{14}\text{O}_4\text{S}$: C, 58.63; H, 5.30. Found: C, 58.34; H, 5.30.

(1R, 2R, 3S, 4R)-5-Benzenesulfonyl-2,6-dimethylcyclohex-4-ene-1,3-diol (37z). To a suspension of CuI (27 mg, 0.14 mmol) in THF (12 mL) was added methyllithium solution (100 μL , 0.14 mmol, 1.4

M in ether) at $-30\text{ }^{\circ}\text{C}$. After stirring at $-30\text{ }^{\circ}\text{C}$ for 15 min, a solution of trimethylaluminum (1.57 mL, 3.14 mmol, 2.0 M in toluene) was added, and the resulting turbid mixture slowly warmed to $0\text{ }^{\circ}\text{C}$ over 30 min. After the mixture was re-cooled to $-78\text{ }^{\circ}\text{C}$, a solution of epoxide 36 (379 mg, 1.42 mmol) in THF (2 mL) was added. The resultant solution was slowly warmed to $10\text{ }^{\circ}\text{C}$ over 10 h under magnetic stirring, quenched with 5% HCl aqueous solution, and extracted by ethyl acetate ($3 \times 30\text{ mL}$). The combined organic layers were washed with saturated aqueous NH_4Cl , dried over Na_2SO_4 , and concentrated via rotary evaporation. The crude residue was purified with flash column chromatography (ethyl acetate/hexanes; 1:1) to afford 370 mg (92%) of 37 as a white solid with $>98\%$ ee by HPLC (ChiralPak AD, 5 cm, 1.0 ml/min, hexane/2-propanol: 90/10, 6.10 min for major enantiomer, 7.65 min for minor enantiomer). Mp $112.0 - 114.0\text{ }^{\circ}\text{C}$; ^1H NMR (CDCl_3 , 300 MHz): δ 7.95 (m, 2H), 7.56-7.67 (m, 3H), 7.14 (d, $J = 4.8\text{ Hz}$, 1H), 4.12 (t, $J = 4.8\text{ Hz}$, 1H), 3.78 (s, 1H), 2.61 (dq, $J = 2.4, 7.2\text{ Hz}$, 1H), 2.11 (br s, 2H), 1.98 (m, 1H), 1.28 (d, $J = 7.2\text{ Hz}$, 3H), 1.16 (d, $J = 7.2\text{ Hz}$, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 142.8, 138.9, 137.9, 133.4, 129.1, 127.9, 75.8, 66.7, 37.7, 31.0, 17.4, 13.3. MS(CI) m/z 283 $[\text{M} + \text{H}]^+$; HRMS (CI) calcd for $\text{C}_{14}\text{H}_{19}\text{O}_4\text{S}$, 283.1004; found, 283.0999.

(1S, 4R, 5S, 6S)-3-Benzenesulfonyl-5-(tert-butyl-dimethylsilanyloxy)-4,6-dimethyl-cyclohex-2-enol (38). The mixture of diol 23 (585 mg, 2.07 mmol), TBSCl (1.0 g, 6.63 mmol), and imidazole (564 mg, 8.28 mmol) in DMF (5.0 mL) was stirred at $70\text{ }^{\circ}\text{C}$ for 20 h under nitrogen. After being quenched by aqueous NH_4Cl , the reaction mixture was extracted with diethyl ether ($3 \times 20\text{ mL}$). The organic layers were washed with brine, dried over Na_2SO_4 , concentrated via rotary evaporation, and further dried in vacuo. The crude residue was dissolved in THF (20 mL), and a THF solution (2.3 mL, 2.3 mmol, 1M) of TBAF was added at room temperature. After being stirred at room temperature for 30 min, the solution was quenched with aqueous NH_4Cl solution, and the product was extracted with ethyl acetate ($3 \times 10\text{ mL}$). The organic layers were dried over Na_2SO_4 and concentrated via rotary evaporation. The crude product was purified by flash column chromatography (ethyl acetate/hexanes; 1:4) to afford 690 mg (84%) of 38 as a white

solid. Mp 106.6-108.5 °C; ^1H NMR (CDCl_3 , 300 MHz): δ 7.86 (d, J = 7.5 Hz, 2H), 7.48-7.62 (m, 3H), 7.00 (d, J = 2.1 Hz, 1H), 4.13 (d, J = 9.3 Hz, 1H), 3.54 (s, 1H), 2.27 (q, J = 6.9 Hz, 1H), 2.01 (s, 1H), 1.78 (m, 1H), 1.24 (d, J = 7.2 Hz, 3H), 1.09 (d, J = 6.3 Hz, 3H), 0.64 (s, 9H), -0.06 (s, 3H), -0.35 (s, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 142.8, 140.4, 139.4, 133.3, 129.2, 128.2, 77.9, 70.7, 37.7, 36.3, 25.6, 18.5, 17.7, 14.9, -4.7, -5.3. Anal. Calcd for $\text{C}_{20}\text{H}_{32}\text{O}_4\text{SSi}$: C, 60.57; H, 8.13. Found: C, 60.82; H, 8.07.

39 Z

(3R, 4S, 5S, 6S)-4-(tert-Butyl-dimethyl-silanyloxy)-6-hydroxymethyl-3,5-dimethyl-tetrahydro-pyran-2-one (39). The crude aldehyde 22 (140 mg) obtained from the previous ozonolysis was dissolved in methylene chloride (4 mL), cooled to -78 °C, then 0.65 mL of $\text{LiAlH}(\text{t-Bu})_3$ solution (0.65 mmol, 1M in THF) was added. After being stirred at -78 °C for 1 h, the solution was quenched with 5% aqueous HCl, extracted with ethyl acetate (3×10 mL). The combined organic layers were washed with aqueous NaHCO_3 , dried over Na_2SO_4 , and concentrated via rotary evaporation. The crude residue was purified with silica gel column chromatography (ethyl acetate/hexanes; 1:1) to afford 60 mg (50% 2 steps) of alcohol 39 as a white solid. ^1H NMR (CDCl_3 , 300 MHz): δ 4.39 (m 1H), 3.93 (dd, J = 7.5, 12.3 Hz, 1H), 3.79 (dd, J = 4.2, 9.0 Hz, 1H), 3.69 (dd, J = 4.2, 12.3 Hz, 1H), 2.56 (m, 1H), 2.20 (m, 1H), 1.38 (d, J = 7.2 Hz, 3H), 1.01 (d, J = 7.2 Hz, 3H), 0.95 (s, 9H), 0.14 (s, 3H), 0.13 (s, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 173.3, 80.5, 74.1, 63.1, 40.9, 35.2, 25.6, 17.9, 14.9, 6.1, -4.4, -4.9. MS(CI) m/z 289 $[\text{M} + \text{H}]^+$; HRMS (CI) calcd for $\text{C}_{14}\text{H}_{29}\text{O}_4\text{Si}$, 289.1835; found, 289.1825.

43β

(1R, 6R)- 5-Benzenesulfonyl-6-methyl-3-phenylsulfanyl-cyclohex-3-enol (43β): To a solution of dienyl sulfone 40 (1.03 g, 4.30 mmol) in THF (50 mL) at -78 °C was slowly added MeLi Et_2O solution (1.4M, 9.3 mL, 13.0 mmol). The resulting orange solution was left stirring for 15 minutes to ensure complete alkylation. After 15 minutes a solution of phenyl disulfide (2.84 g, 13.0 mmol) in THF (5 mL) was added via cannula. The temperature was allowed to rise to 25 °C and the reaction mixture was left stirring for 8 h. A solution of saturated NH_4Cl (50 mL) was added to the mixture followed by Et_2O

(100 mL). The aqueous phase was extracted with Et₂O (2 X 100 mL) and the combined organic extracts dried over MgSO₄ and concentrated. The product was purified via column chromatography using silica gel to give 1.26 g (82%) of pure 43β (one diastereomer). ¹H NMR (300 MHz, CDCl₃) δ 7.77 (m, 2H), 7.63 (m, 1H), 7.51 (m, 2H), 7.35 (m, 5H), 5.29 (dt, J = 1.4, 4.3 Hz, 1H), 4.19 (m, 1H), 3.62 (m, 1H), 2.47 (m, 1H), 2.31 (m, 1H), 2.15 (m, 1H), 1.12 (d, J = 6.9 Hz, 3H). ¹³C NMR (75 MHz, CDCl₃) δ 140.1, 137.7, 133.7, 133.5, 131.4, 129.3, 129.1, 128.9, 128.4, 113.9, 69.1, 67.3, 34.7, 32.3, 14.1; LRMS (CI): m/z 361 (M+H)⁺, 219 (Base peak); HRMS (CI): Calculated for C₁₉H₂₁O₃S₂ 361.0932, found 361.0926.

It is to be understood by those skilled in the art that the foregoing description and examples are illustrative of practicing the present invention, but are in no way limiting. Variations of the detail presented herein may be made without departing from the spirit and scope of the present invention as defined by the following claims.
